SURVEY DEPARTMENT.

REPORT OF THE SURVEYOR-GENERAL FOR 1902.

HAVING returned from leave of absence late in the year, the 4th August, when survey operations in the field were drawing to a close, my report must necessarily be more or less confined to a statement of work accomplished. The surveys were of the same nature as in previous years, viz., Topographical, Block, and Application, with a connecting chain of triangles in the north-west to link up former work. Recess commenced in October and was carried well into the following year, as I continued the system introduced last recess of having the fixation of title plans and computations of areas, and in addition the preparation of tracings for process work, attended to during recess under the supervision of the Superintendents instead of at headquarters. This will reduce the field outturn for 1903; as, however, field operations are still considerably in advance of plan work, and the demands for preliminary plans of application and block surveys as well as maps are urgent, the latter must now receive first attention.

The topographical parties were scattered over the Northern, North-Central, Central, North-Western, and Southern Provinces, so as to complete the one-mile-to-an-inch survey of these parts of the Island, where little or no information was available even for a small scale map. This made supervision difficult and to a certain extent curtailed operations, but will enable me to produce a good eight-mile-to-an-inch map next year. The area covered by the several parties was 3,065 square miles, and the cost rate Rs. 32·14 per square mile, within which no less than 3,507 tanks were located, a most creditable outturn.

The ten-inch-to-the-mile block surveys were practically confined to the Northern, North-Central, North-Western, Sabaragamuwa, Uva, and Southern Provinces, the areas taken up in the Western and Eastern Provinces being insignificant. The work is good and useful, and can, in consequence of the extra work before referred to being attended to during recess, be rapidly reproduced. The area covered is 212,858 acres, and the cost rate per acre 47 cents.

Application surveys received considerable attention, no less than 3,101 cases, including special surveys, having been disposed of. This excellent outturn is largely due to the systematic manner they are now dealt with, although this branch of the service can have no programme, and never knows before the demands the following month may entail, as will be seen on reference to the return headed "Number received each Month" in the Superintendent of Applications' report. It is most trying work in every respect, requiring constant care and close supervision, so that the outturn for the year, 34,293 acres at a cost rate of Rs. 2·77, with an average staff of 39 surveyors, is very good. It must be remembered that these surveys, which only average about 5 acres in extent, and all of which must be connected to trigonometrical points or old surveys, are scattered over the length and breadth of the Island.

The triangulation in the north-west referred to was not completed, only nine points out of the fourteen having been observed from before the weather broke and made further observations impossible, but the other five points are now (1903) receiving attention.

Land sales show a marked increase over the two previous years (*vide* the return in the Appendix). The area alienated was 38,117 acres, and the amount realized Rs. 737,539.

Surveys made in 1902.

	Acres.
Block Surveys	212,858
Topographical	1,961,600
Application	34,293
Total ...	2,208,751

Expenditure ...	447,674	480,280	567,613	608,757	639,798	656,489	640,632

The total area surveyed since 1st January, 1897, up to end of 1902 was 11,100,441 acres, and the cost Rs. 3,593,569. The area surveyed during the previous six years was 470,492 acres, and the cost Rs. 2,711,315.

GENERAL REMARKS ON SURVEY OPERATIONS.

The most interesting branch of the Department is without doubt the Topographical Survey, particularly of those parts of the Island which were practically blanks on the map as late as 1897. It

has been most interesting to watch the gradual unfolding of the numerous old irrigation schemes with their, literally, thousands of dependent tanks. This portion of work is now drawing to a close, for, with the exception of comparatively small areas, the whole of the north, north-central, and east of the Island has been surveyed and mapped, this year's operations having filled up all the larger gaps, leaving only a strip of what may be termed wild country between the Laggala, Knuckles, Medamahanuwara range, and the Mahaweli-ganga, part of the Puttalam District, and the outlying districts in the Southern Province and Sabaragamuwa. Fifteen thousand square miles have been mapped on scale of one inch to a mile, and about 2,000 by the block survey parties on the scale of ten inches to the mile, so that we have covered over 17,000 square miles out of the 25,000, which is the approximate area of the Island, since survey operations were commenced in 1898. The previous year was occupied in training the staff (105 surveyors have been trained up to date) and reorganizing the Department, although some comparatively small areas were surveyed, such as Tamankaduwa in the North-Central Province, more however as a training for the topographical staff than anything else.

Next year (1903) would see the completion of the areas for which the one-inch-to-the-mile survey is best suited, if a large force of the topographical staff could be devoted to it; this I do not contemplate, believing it would be more useful to continue the one-mile survey where it is absolutely necessary, and to scatter the rest of the staff in the Central, North-Western, Sabaragamuwa, and Southern Provinces to fill in details in the old surveys, to enable me to publish a reliable map of the Island on the scale of eight miles to an inch next year. There is no map of the Island at the present time; there are numerous sketches which give one a general idea of direction and distance, but no map one can use with any degree of certainty; in fact, over three parts of the Island represented on them the whole of the features, except a few main roads, are ridiculously inaccurate. Take, for instance, the four-mile map, which shows a first class road from Hambantota to the Jaffna peninsula!. I have, I think, made it clear why it is desirable to mark time a little with the one-mile topographical surveys, and to publish a reliable small scale map at an early date. This is all the more necessary now we have approached the more civilized districts, which are also mountainous, as the scale of the topographical maps must be increased to show rough contours, and consequently the outturn will be largely reduced. So far we have more than kept pace with the estimated hundred square miles per surveyor per annum, for we have completed the 15,000 square miles referred to in five years, although the staff rarely had its full force of thirty men.

The block surveys, which have covered about 2,000 square miles, are of the utmost importance, as on the plans of these surveys settlements are being made. Nothing gives one a better idea of the class and quality of this work than to place the plans side by side with the old application survey sheets, and then to compare the cost per acre. Under the old system the field sheets from constant transport to and from headquarters were always more or less torn and often so patched as to make accurate work impossible. One would find surveys of little patches of land, say, a dozen—aggregating 50 acres, connected to long traverses with more or less swing on them.

The complete ten-inch-to-the-mile block survey sheet affords a striking contrast, being properly connected to trigonometrical stations within the survey, all forests, chenas, tracts of fields, blocks of gardens, and in many cases subdivisions for settlement, topographical features, &c., clearly and accurately laid down on strong mounted sheets—a permanent record of 4,800 acres, which should be as clear twenty years hence as it is to-day. These plans are reproduced by photo-lithography and issued to Government Agents and the Special Officers for settlements under the Waste Lands Ordinance. This year plans of 97,333 acres were issued, and during the last six years plans of no less than 277,780 acres have been forwarded to the officers referred to. The reproduction of these plans has no doubt, as the Assistant Surveyor-General notes, been greatly accelerated by the assistance he has received from the Superintendents during recess; at the same time there are certain drawbacks in giving field hands so much office work, such as lengthening the recess period, &c., that when the new studio has been completed (it has not been commenced yet), and the whole of the processes for reproduction are in full working order, he will have ample means at his disposal to attend to everything but the fixation of title plans, delicate work requiring skill and care, which can only be acquired by long practice, and for which there is now hardly a draughtsman at headquarters capable of undertaking the work.

In addition to the preliminary plans for Waste Lands Ordinances settlements, a large number of ordinary application and special surveys preliminary plans (1,658, aggregating 36,085 acres) have been sent to the Kachcheries, the majority being for land sales. This year the amount realized from this source was Rs. 737,539. The increase during the last six years over the previous six is most marked, being Rs. 3,970,724 against Rs. 2,576,185.

During my absence from the Colony on leave from April, 1901, to August last the Department was administered by the Assistant Surveyor-General, during which period the outturn by the Department has been well maintained.

Mr. Templeton, Superintendent of Topographical Surveys, took advantage of a trip to India to make himself acquainted with field methods, particularly topographical work in a hill country, which will be very useful to us now we have reached the mountain zone, and also some of the processes for the reproduction of plans. This officer has had charge of the Topograpical Survey throughout, and to him its success is largely due.

Mr. R. B. Campbell, Superintendent of Surveys, North-Central Province, was unwell throughout the year, and eventually, I much regret to say, became nearly blind. He retired on the 8th September, 1902, and his brother, Mr. F. W. B. Campbell, Superintendent of Surveys, Central Province, a very careful officer, who was obviously the most suitable official to straighten things out, was placed in charge. He became ill and had to leave the Province, and to my extreme regret died on the 17th March, 1903, of a long-standing malady, of which neither he nor any one else had the least suspicion.

Mr. Ohlmus, Chief Clerk, who had served Government for forty years, retired on the 19th November, and has left a blank which cannot be filled. His knowledge of everything connected with the Department was invaluable, whilst his high character and tact made him respected by all with whom he came in contact.

F. H. GRINLINTON,
Surveyor-General.

April, 1903.

INSPECTIONS.

By the Acting Surveyor-General.

January : North-Western.
February : Eastern.
March : Southern.
April : Western and Central.
May : North-Central.
June : North-Central and Eastern.
July : Northern, North-Central, and North-Western.

By the Surveyor-General.

September : North-Central, Sabaragamuwa, and North-Western.
October : Southern.
November : Uva and Northern.
December : Northern and North-Central.

PROVINCIAL REPORTS.

Southern Province.—Mr. S. J. C. More.

PLANS of block survey made in 1901 were not despatched to headquarters until the end of April, 1902, recess being greatly prolonged, as it was required that all lot areas should be computed and tracings made of all plans for photo reduction. Most of the surveyors were unfamiliar with computation work, and progress therewith was slow.

Block surveyors were divided into three parties, one of seven surveyors under Mr. Maddock going to the Giruwa pattu of Hambantota District, another of two surveyors to Weligam korale of Matara District, and the third of nine surveyors under Mr. A. H. G. Dawson to Hinidum pattu of Galle District, and on the average all were at work about the 11th April. Mr. Dawson went on leave at the end of July, when Mr. C. O. van Dort took charge of the Hinidum party. The weather in Weligam and Hinidum pattus was generally bad during the field season, though health was good, the reverse being the case in Giruwa pattu.

In the aggregate the area covered is 70,337 acres in 6,823 lots at a cost of Rs. 43,142·81, or 61⅓ cents per acre for lots averaging 10⅓ acres. These figures, I submit, are very satisfactory, considering the length of recess necessary to cope with increased work there. The Hinidum party surveyed 34,839 acres in 1,911 lots, an average of 18·2 acres per lot, at a cost of 55½ cents per acre, the average progress being 704 acres per month per surveyor. The average would have been 756 acres, but that I have had to leave out one surveyor's work covering 2,650 acres, as there were so many misclosures in it. The Weligam korale party surveyed 7,310 acres in 1,143 lots, the average extent being 6·3 acres, at a cost of 51¼ cents per acre, the average monthy outturn being 665 acres, which may be considered very creditable for such small lots. The Giruwa pattu party covered 28,188 acres in 3,769 lots, the average size being 7½ acres, at a cost of 71 cents per acre, the average outturn being 788 acres per month.

Eighty villages in all have been completely surveyed, and forty-three partly surveyed, as under :—

In Morawak korale nine villages, viz., Dombagoda, Kiriwaldola, Lankagama, Matugobe, Mederipitiya, Pallegama, Patawala, Poddana, and Wattugala.

In Hinidum pattu eighteen villages, viz., Andadola, Ahalapitiya, Baranawala, Bopitiya, Dombagoda, Gigaruwa, Hapitigama, Kadahirigala, Kosmula, Lankagama, Maguntenna, Miyannawatura, Panagoda, Panangala, Parunimula, Polgampola, Radagoda, Tambalagama, Wattugala. Ten villages were left incomplete, viz., Batuwangala, Bungama, Hinidum,* Haberakada, Mawitagama, Menikowita,* Madugeta,* Neluwa, Nilweligama, and Peddapitiya, those marked * being nearly completed.

In Giruwa pattu thirty-five villages have been completed, viz., Ambagahahena, Areboda, Athpitiya, Agaleboda, Buweligoda, Bowale, Bodimaluwa, Ehala Bukendayaya, Galpothukanda, Hingurukanda, Horawella, Kongastenna, Karamatiya, Katuwana, Bintenna, Kehelwatta, Karawilakanda, Kanumuldeniya, Kabaragomaditta, Linthotapaya, Meegahahena, Madakanda, Medagangoda, Natuwella, Omare, Pingalella, Panganwelleyaya, Peddapitiya, Ranasingoda, Udawelamula, Udakiriwela, Wattukanda, Walgammula, Wettambuwara, Wallasmula, and Yakgasmula. Twenty-nine villages were partly surveyed, viz., Attuboda,* Amedamuna, Brahakuranayaya, Budiyagama,* Galahitiya, Hatamuna, Hadiwatta, Horawinna,* Ittidemiliya, Keppitiyawa,* Koholana, Katuwana, Kinchiguna, Kinchiguna Medagama, Kapugampota, Malayagoda, Medagama, Mandaduwa, Medamulana, Muruthewela, Medatisamuna, Marakada, Namanaeliya,* Pallemullana, Pahala Bukendiyaya, Raluwa, Radeniaar, Welandagoda,* and Wadikanda. Those marked * have been nearly completed.

In Kandaboda pattu six villages, viz., Baddabedda, Denagama, Kebeliapala, Kurunaikemula, Miella, and Pananwela.

In Weligam korale eleven villages have been completed, viz., Akuressa, Bopitiya, Higgoda, Imbulgoda, Koragoda, Kohugoda, Kerawaboka, Maliduwa, Marambe, Porambe, and Yakabedda. Four villages partly surveyed, viz., Asmagoda, Ganhela, Ketanwila, and Minipogoda.

Main Circuits.—117 miles of main circuit traverse were run, the co-ordinates being checked and adjusted by me, the work generally proving excellent.

Triangulation.—Thirty-nine old and new points were established on the new fixing, observations being taken by various surveyors and the calculations made by me.

Recess commenced at the beginning of October, and would probably have closed early in January had it not been required that all title plans should be located and inserted on block survey plans, a duty that proved very heavy and for the first time delegated to recess parties.

Plans, with tenements perfected in all respects of the Hinidum and Weligama sections, were despatched to headquarters on the 17th February, and those of the Giruwa and Kandaboda pattus in March.

Application Surveys.—The year commenced with arrears of 30 applications and 24 special questions; 608 applications and 88 special questions were received during the year. Of these, 372 applications and 61 special questions were attended to, leaving a balance of 266 applications and 51 special questions unattended to at the close of the year. This large balance is due to the fact that 230 applications and 14 special questions were received only in November and December, when surveyors were busy with plan work.

Plans were sent in for 1,388 lots covering 2,926 acres, the average size being 2 acres per lot, the cost being Rs. 9,768, or at the rate of Rs. 3·33 per acre, which compares favourably with cost in previous years. Plans of only thirty-six surveys were outstanding at the close of the year.

Sabaragamuwa.—Mr. C. C. M. Fyers.

I RESUMED charge of this Province on the 24th June on my return from home leave. Five surveyors were employed on block surveys in the Kukulu korale. Twenty main circuit traverses were surveyed, giving a total of 3,982 chains, equal to 49¾ miles.

The following villages were surveyed, viz., Ayagama, Gawaragiriya, Kutikanda, and Galatura. Partly surveyed Dumbara. The total extent surveyed was 17,662 acres 1 rood 1 perch, and the number of lots 798. The average extent of lots is therefore about 22 acres. The 17,662 acres 1 rood and 1 perch were surveyed at a cost of Rs. 15,066, or 85 cents per acre. This includes supervision, travelling, cooly pay, salaries, leave, and two months' recess.

The following new check points were selected, cleared, observed, and computed by the Superintendent of Surveys:—Natawakanda, Kongalahela, Yakahatugala, Mawarakanda, Talapatgala, Kondagala, Eherakota, Katukitulkanda, and Burutagalagodana.

All record sheets, including the computation of each lot, tracings for ferro-gallic purposes, tenement lists copied on the new forms, were completed, and plans forwarded to the Head Office on the 9th December. Ferro-gallic copies of the entire year's work were, I am given to understand, in the hands of the Government Agent by the 31st December.

Application Surveys.—Seven applications and 26 special questions were in hand on the 1st January; 47 fresh applications and 53 special questions were received during the year. Forty-two special questions were disposed of, showing a total of 10,528 acres, 579 lots; average extent of lot 18 acres; cost per acre 74 cents. Thirty-six applications were surveyed; extent 977 acres; cost per acre Rs. 2·41. The plans of all applications and special questions were also forwarded before the 24th December.

Uva.—Mr. J. W. Viner.

THE work done was chiefly application surveys and the completion of the survey of the Muppane and Batugammana claim, which, although surveyed on Government requisitions, is treated as a block survey.

Applications.—There were surveyed during the year 97 applications and 24 special questions, and 92 and 23 respectively were received, which left in hand at the end of the year 34 applications and 11 special questions. The total area surveyed was 614 acres in 217 lots, the average extent of lots 2 acres 3 roods and 13 perches, and the cost per acre Rs. 10·46, which is higher than it should have been. The total cost was Rs. 6,427·37.

Block Surveys.—Including under this head the Muppane and Batugammana claims previously referred to, 12,472 acres were surveyed in 137 lots, all in the Wellassa division, and the surveys included the completion of the villages of Batugammana, Muppane, Uduwela, Dambagala, and Galbokke, and the partial survey of Therala and Obegoda villages. The cost of the work was Rs. 7,499, at a cost rate of 60 cents per acre, the average extent of the lots being 91 acres. It would have been less but for an unusual amount of sickness among the field party.

Triangulation.—Three check poles were established, but the two attempts made to establish Galbokke station upon the Namanakuli-Ulgala base was not successful, chiefly for want of a sufficiently powerful telescope.

Miscellaneous Work include the survey of the catchment area for a proposed scheme for supplying Bandarawela with water, also the incomplete survey of Bandarawela town, surveys at the Haputale railway slip, &c.

Batticaloa District.—Mr. J. W. Viner.

THE work done included principally the survey of applications and the blocking out of lots under incomplete irrigation works.

Applications.—There were surveyed during the year 100 applications and 14 special questions, and 58 and 18 respectively were received, which left on hand at the end of the year 20 applications and 10 special questions only. The total area surveyed under this head was 3,690 acres, which included 1,527 acres blocked out under Tumbichchiya tank and 1,088 acres under proposed anicut across the Talipot-aru (Akkarai pattu). The number of lots was 511, the total cost Rs. 8,140·52, the average extent of lots 7 acres and 35 perches, and the rate per acre Rs. 2·20.

Block Surveys.—Of these surveys, only 350 acres in the Rugam pattu were completed. The plans of a larger block in the Sammanturai pattu were not passed, as the title plans within the surveyed area could not be adjusted during recess on the data available.

Miscellaneous.—The survey was completed of a large area of the peninsula to the south-east of Batticaloa lake, and 380 acres blocked out into small dwelling-house lots to relieve the congested population of the roadside villages, and the boundaries of the Batticaloa-Kalmunai road were re-defined and the encroaching fences set back.

Triangulation.—Only two check poles were fixed during the year, more not being required for the nature of the work done.

Central Province—Mr. J. L. Hampton.

Application Surveys.—At the commencement of the year 44 applications and 28 special questions were in hand, during the year 72 applications and 74 special questions were received, and 49 applications and 66 special questions were dealt with, leaving 67 applications and 36 special questions in hand at the close of the year. The total area surveyed in the Province was 1,311 acres 2 roods and 12 perches, comprising 538 lots, the cost being Rs. 5,811·84. This gives the rate per acre Rs. 4·43, and the average extent is 2 acres 1 rood and 18 perches.

Railway Acquisition Surveys.—The total area surveyed was 3 acres and 19 perches, comprising 35 lots, the cost being Rs. 359·43. This gives the rate per acre Rs. 115·03½ (*vide* my remarks on the high rates in my North-Western Province report), and the average extent is 14 perches.

Experimental Garden Survey at Gangaroowa.—Two surveyors were engaged on this work during 141 days, 122 blocks (eight of 10 acres, fifteen of 5 acres, and twenty-one of 1 acre) were marked out on the ground. Subsequently the 10-acre lots were subdivided into 5-acre lots, all the above lots carrying 12-ft. reservations for roads. The area surveyed and triangulated was 529 acres at a cost of Rs. 1,981·92.

Nuwara Eliya Contour Survey.—Two surveyors were engaged during the year at various times, when their services were not required for more pressing survey, on this work. The cost of the 1902 contouring, which will not be completed before the close of 1903, amounts to Rs. 3,324.

North-Western Province.—Mr. J. L. Hampton.

THE block surveys in this Province were confined to the Chilaw District. A slight departure from the regular system was carried out, as the usual method over a country so much covered with old title plan surveys would have involved the re-survey of lands alienated from the Crown (a needless expense), which the new scheme was calculated to obviate. The 1902's surveys, therefore, were limited to the outline of the old title plan surveys, and have since afforded data for compiling and bringing into true position the old and erroneous traverses of former years.

A survey party of five supernumerary surveyors controlled by a Second Grade Surveyor, Mr. G. F. Hepponstall, was occupied in the field between March and October. The surveyor in charge traversed the initial main circuit traverse of 22½ miles from the Chilaw Trigonometrical stage along the Chilaw-Puttalam road and closed it well, and the 139 miles of the other main circuit traverses built upon it proved of good quality.

One factor which handicaps a surveyor in the North-Western Province is the heavy clearing of boundaries through dense, stunted, and tangled vegetation. The 82 villages thus dealt with, exclusive of the title plan batches surveyed, are given below, and give 29,202 acres, 31¼ average extent, and 44½ cents average cost per acre; inclusive of title plan batches surveyed: area 31,464 acres, lots 1,032, average 41 cents, the total cost being Rs. 12,924.

Villages surveyed.—Pankulam, Illakatuwa, Nellunkuliya, Hellambawatawana, Nalladarankattuwa, Irakkawella, Suruwilla, Maiyawa, Anaivilundawa, Nagul Eliya, Deganwewa, Bombiyawela, Sippikalana, Weerapandiyana, Alutkurumulla, Villatawa, Eliwitiya, Thukiniyagama, Rambapitiya, Nariyagama, Dematapitiya, Urudayandaluwa, Arachikatuwa, Bandarahena, Kelegama, Midellawatuwana, Erumwala, Udappuwa, Pulichakulam, Kiriyankali, Puthukudiyirippu, Anaierakkam, Muthupanthiya, Maradancholai, Wellawella, Pinkitiya, Gorakahapokuna, Tarakudiwila, Hinguregama, Tamarakulam, Kottage, Panaiyadikulam, Kussalai, Peekulam, Karukkupanai, Welandikulam, Kumbuttukuliya, Amakuliya, Manaweriya, Kotapitiya, Kurugampola, Bangadeniya, Werakomandaluwa, Sittamadama, Karukkuliya, Mukandaluwa, Tambarakulama, Mahagama, Elapahela, Yodaela, Puliyankara, Kokkawilla, Puliyankadawara, Dambuwa, Brahmanadaluwa, Ganankattiya, Siyambalagaswewa, Kanukattiya, Karawita, Kuda Savarana, Mudaliyawela, Sedarawella, Dematapitiya, Madamawella, Ratmalagara, Tambagala, Medagama, Attangane, Battulu-oya, Iyanawela, Vendakaduwa, and Pyrandawa.

Sixty-one applications and 18 special questions which fell within the limits of this survey were disposed of at a cost of Rs. 1,843·81 (2,513 acres 2 roods 8 perches, 572 lots, average extent 4½ acres), the cost per acre being 73⅓ cents, against Rs. 2·17 surveyed by the application staff.

Miscellaneous.—64½ miles of road, 16 of footpath, and 40 miles of streams were mapped in connection with this survey.

Application and Special Questions.—At the commencement of the year 55 applications and 54 special questions were in hand, during the year 102 applications and 24 special questions were received, and 124 applications and 69 special questions were dealt with, leaving 33 applications and 9 special questions in hand at the close of the year. The total area surveyed in the Province was 5,104 acres and 37 perches, comprising 984 lots, the cost being Rs. 11,076·42. This gives the rate per acre Rs. 2·17, and the average extent is 5 acres and 29 perches.

Railway Acquisition Surveys.—The total area surveyed was 9 acres 1 rood 28 perches, comprising 14 lots, the cost being Rs. 528·92. This gives the rate per acre Rs. 56·04, and the average extent is 2 roods and 28 perches. These small surveys (additional side widths for construction purposes) are paid for by the Railway Extension Department, but the high rate per acre needs some explanation. They are asked for from time to time in small batches, and the time taken by our officers in getting to them and back to their stations makes the travelling bills very heavy.

North-Central Province.—Mr. C. Meuden.

MR. R. B. CAMPBELL was in charge of the Province on the 1st January, and gave over to Mr. J. W. Robertson in February, who handed it to Mr. F. W. B. Campbell on the 4th November.

The block selected for block survey in 1902 is situated north of the Kala-oya and adjoined work taken up in 1901. Seven surveyors were employed on the work, one of whom resigned.

The total area surveyed during the year was approximately 47,671 acres in 732 lots, and the cost was Rs. 13,004. Out of this, about 688 acres were in Kende korale, and the number of lots being 8, giving an average extent of 86 acres, the cost rate of the work, including sick leave and holidays, was 29 cents per acre. In the Nuwaragam korale the extent surveyed was approximately 6,003½ acres, the number of lots being 107, giving an average extent of 56 acres and 16 perches. The cost rate of the work, including sick leave and holidays, was 32 cents. In the Kanadara korale the extent

surveyed was approximately 2,813 acres, the number of lots being 29, giving an average extent of 97 acres. The cost rate of the work, including sick leave and holidays, was 14 cents per acre. In the Ullagalla korale the extent surveyed was approximately 12,107 acres, the number of lots being 218, giving an average extent of 55 acres 2 roods 5 perches. The cost rate of the work, including sick leave and holidays, was 22 cents per acre. In the Eppawala korale the extent surveyed was approximately 21,580½ acres, the number of lots being 295, giving an average extent of 73 acres and 24 perches. The cost rate of the work, including sick leave and holidays, was 29 cents per acre. In the Kelegam korale the extent surveyed was approximately 4,479 acres, the number of lots being 75, giving an average extent of 59 acres 2 roods and 33 perches. The cost rate of the work, including sick leave and holidays, was 35 cents per acre.

Villages surveyed.—Nuwaragam korale: Mehiellewa, Doranewa, Watuepoliyagama, Kelegama, Pahalagama, Potiyagama, Gurugoma, Acheirigama, Watiagama, Solanwewa, Turuwila, and Kiriamunukola.

Eppawala Korale: Kudawewa, Hammillewa, Nawagattegama, Dematawewa, Weerawewa, Erianawa, Kiritokuwa, Thoduthokatiya, Rambawewa, Maha Palugaswewa, Kuda Palugaswewa, Atorawa, Mylewa, Galayagama, Galenbindunuwewa, Medanikallu, Kalundagama, Pantiawa, Wajayakulama, Kudagama, Maha Kanumulla, Tammanagala, Achariyakulama, Golupettawewa, Marikarigama, Eyeyatayagama, Ulankulama, Gallewa, Payandikulama, Tammanagama, Puliankulama, Siambalawa, Bulnewa, Kadigawa, Mediyawa, Kurukeppittiyawa, Ambagaswewa, Ihala Taranagollawa, Pahala Taranagollawa, Kivulpitiya, Galwaduwagama, Ipolagama, Uhumigama, Kelediwulwewa, Horumbuagama, Brahakmanagama, Pahala Halmillawa, Achariyagama, Nambedawa, Konittegama, Dangollagama, Henapolayagama, Maha Illupallama, and Maduragama.

Kende Korale: Kudawewa and Hamillewa.

Kanadara Korale: Polanhayagama, Kidagala, and Aturuwella.

Ullagalla Korale: Tirappana, Tithithegama, Kunchikulama, Karawalagaswewa, Andarawewa, Pahala Mawatawewa, Ihala Mawatawewa, Heinmawatagama, Habakudawewa, Wettankulama, Sellattumaduwa, Ihala Kongaswewa, Pahala Kongaswewa, Golumaradankulama, Palayakulama, Hammillakulama, Puliankulama, Golupettawewa, Kusawa, Nilathapatiya, Pandiankulama, Pattikulama, Kottanayankulama, Borawewa, Weerapudikulama, Wellamaduwa, Kunchikulama, Dematawewa, Sembukulama, Ataweerawewa, Kudawewa, and Kudukanumulla.

The following villages were partly surveyed in previous years and completed in 1902:—Eppawala Korale: Maha Belankadawala, Rajapaksegama, Malwana, Ihalagama, Alutwewa, Eppawala, Medagama, Pottegama, Galmaduwa, and Kumbukwewa.

A few villages were only partially finished in 1902:—Kanadara Korale: Mihintale, Illuppakkaniya; Eppawala korale: Lunuwewa and Katiyawa; Kende Korale: Kummalakkulama.

Villages wholly surveyed	103
Villages partly surveyed in previous years and completed this year ...	10
Villages partly surveyed this year	5
Total ...	118

At the beginning of the year there were in hand 79 applications and 9 special questions, during the year 271 applications and 31 special questions were received, and 230 applications and 25 special questions were surveyed, leaving 110 applications and 15 special questions in hand at the end of the year. The total area surveyed in the Province was 3,609 acres and 24 perches, comprising 290 lots, the cost of the work being Rs. 9,496·99. This gives the rate per acre Rs. 2·63, the average extent of each lot being 12 acres 1 rood 31 perches.

Triangulation.—Observations were taken at Kadiagala, Otapuwa, Getalagamakanda, Tammanakanda, Mylagaswewakanda, Usgalla Wehera, Niyandigalla Wehera.

Misvellaneous.—The health of the officers in this Province appears to have been very bad, Mr. R. B. Campbell having had to go on pension owing to ill-health, and Mr. F. W. B. Campbell is now seriously ill in the Kandy hospital.* Mr. Perera, one of the clerks, has, I learnt, died in Colombo owing to the malaria contracted here. The block surveyors, however, do not seem to have suffered so much this year as in former years, and I attribute this to the experience they have gained in taking care of themselves. I think there would be even less fever among them if the large stills which have been returned by the Topographical Branch as too heavy and cumbrous for the nomadic life led by their officers be issued to men out here.

Western Province.—Mr. A. E. Wackrill.

THE work in the Province was principally application and special question surveys. Some was also done in connection with the Kelani Valley Railway. Two surveyors were engaged on block surveys during the latter half of the year.

Application Surveys.—At the beginning of the year there were in hand 153 applications and 16 special questions; during the year 480 applications and 84 special questions were received from the Head Office for attention. The questions surveyed during the year were 496 applications and 81 special questions; two applications were cancelled, thus leaving at the close of the year a balance of 135 applications and 19 special questions in hand. The number of surveyors employed in these questions varied from three to eight, the average number being six. The total area surveyed was 2,135 acres in 1,209 lots, the average extent of a lot being 1·77 acre. The total cost was Rs. 20,886·13, giving an average cost per acre of Rs. 9·78. The main reasons for this high rate were the scattered nature of the work, the time occupied in supervising the work of the Colombo Municipal assessment surveyors, the calls for urgency which necessitated certain questions being taken up out of the order which their location indicated, and the unsatisfactory work of a surveyor, who was removed in June to a sphere better suited to his capacity.

* He has since died.

Railway Acquisition Surveys.—A surveyor was engaged at various times in making surveys of small additional lots to be acquired by Government for the Kelani Valley Railway. This work, which occupied him for twenty-one days and cost Rs. 177·07, gave an outturn of only 24 lots, with a total extent of 1 acre 3 roods and 26 perches.

Block Surveys.—The block chosen was in the Hewagam korale, a continuation to the south and west of the previous year's work. The western portion of Tunnane village was completed by Mr. Hunter. The work of the other surveyor was found inaccurate, and had to be cancelled. The area surveyed by Mr. Hunter was 477 acres 3 roods 23 perches in 42 lots, giving an average extent of 10 acres 2 roods 26 perches. The cost of his work alone was at the rate of Re. 1·18 per acre, but the total cost of the work of the two surveyors being Rs. 1,628·29, the cost per acre works out at Rs. 3·41.

Miscellaneous.—Three surveyors, whose salaries and cooly pay were furnished by the Colombo Municipality, but the cost of whose supervision fell on this Department, were employed in revising the Colombo town map for assessment purposes during the greater part of the year.

I have departed from the prescribed form of Field Sheet Register, and am using instead a card index, thereby saving labour in making entries and time in making reference.

Northern Province and Trincomalee District.—Mr. W. C. S. Ingles.

Supervision.—This charge consisted of all surveys in the Northern Province, including the Trincomalee District and a small portion of the North-Central Province. The supervision was frequently changed throughout the year, chiefly owing to the sickness of the officers concerned. Mr. J. W. Robertson, Assistant Superintendent of Surveys, held charge until 5th March, when Mr. R. B. Campbell, Superintendent of Surveys, took over from him. On the 10th June Mr. Campbell being incapacitated for work by illness, Mr. Speldewinde, Assistant Surveyor, took charge until the 4th July, when Mr. Wickwar, Assistant Superintendent of Surveys, took over, until on the 8th September he left on sick leave for England, and I assumed charge.

Staff.—The number of assistants at the beginning of the year was ten. Of these, four were engaged completing 1901 work up to April, and did not begin their new blocks until that date; and as recess began this year strictly from the 1st October, the outturn of field work was somewhat affected.

Block Surveys in Kadawat Korale.—Three surveyors were employed on the block surveys in the Kadawat Korale, North-Central Province, completing the survey on both sides of the Northern Railway as far as the Northern Province boundary. The outturn was good for the time they were engaged.

The following thirty-one villages were surveyed:—Kuda Hammillewa, Kongaskada, Wattarakkewa, Kuda Punewa, Kudagama, Maha Kumbukgollewa, Ihala Galkandagama, Timbirawewa, Pahala Galkandagama, Dachchidamana, Kanugehawewa, Periyakulam, Kuda Kongaskada, Tammanewewa, Puhuldiula, Kuda Kumbukgollewa, Medagama, Kuda Siyambalagaswewa, Maha Siyambalagaswewa, Galkandagama, Kattukeliyawa, Bulatikulama, Kohombagaswewa, Anekettiya, Siyambalagaswewa, Nawakkulama, Karagaswewa, Marakkala Hammillewa, Kidawarankulam, Punewa, and Nagadaranewa.

In the course of this survey seventeen main circuit traverses were surveyed and chained twice to ensure greater accuracy, as some of the 1901 work which it adjoined did not quite come up to the required standard. The total distance of these was 5,189·79 chains, or over 64 miles.

The total extent surveyed was 23,099 acres 2 roods 35 perches, the number of lots being 274. This gives an average extent per lot of 84 acres 1 rood 9 perches. The total cost of the work was Rs. 7,034·83, showing a rate per acre of 30½ cents.

These main circuit traverses embrace several villages left unsurveyed, and it would be well to take them in hand early in 1903 while the lines are open, as some of them are cleared; another 7,000 acres could be easily surveyed at a very small cost.

As the staff available for block surveys is so small, rather than to attempt at present a continuous survey along the line it would be better to confine attention to the country in the immediate vicinity of all station sites on the Northern Railway, to prevent encroachments, safeguard the interest of Government, and to meet the demand for land which is sure to arise as soon as the railway is opened.

Block Surveys in Vadamaradchi East, Jaffna Peninsula.—Two surveyors were employed in Vadamaradchi east, Northern Province, blocking out the small strip of land between the "kalie" or lagoon and the sea.

The following villages were surveyed:—Chempiyanpattu, Maratankeni, Vattirayan, Kudarappu, and Nagerkovil. From these surveys several old title plans were placed in true position. Thirteen main circuit traverses were run in connection with this work, the total distance bein 7,395·55 chains, or over 92 miles.

Two villages, viz., Udutturai and Aliyavalai, were only partly surveyed. These can be easily finished at very little cost. They had to be left, as they were only half surveyed by the 30th September, when recess began. As it turned out, the excessive wet weather would have prevented any further work being done.

The total extent surveyed was 10,153 acres and 10 perches, the number of lots being 484. This gives an average extent per lot of 20 acres 3 roods 36 perches. The total cost of the work was Rs. 1,713·75, showing a rate per acre of 17 cents.

Application and Special Question Surveys.—At the commencement of the year in the Northern Province there were 93 applications and 27 special questions in hand; during the year 179 applications and 9 special questions were received. Of these, 194 applications and 28 special questions were surveyed, leaving a balance of 78 applications and 8 special questions at the end of the year. The approximate extent was 1,631 acres, and total cost Rs. 7,686·96, showing a rate per acre of Rs. 4·71. Mullaittivu again heads the list with 126 applications of an average extent of 2 acres, against 181 applications of an average extent of 3 acres during 1901. Fourteen acres were surveyed for railway acquisition in 53 lots at a cost of Rs. 199·65.

On the 1st January in the Trincomalee District, Eastern Province, 86 applications and 26 special questions were in hand, 106 applications and 1 special question were received, out of which 124 applications and 22 special questions were surveyed, leaving a balance of 68 applications and 5 special

questions at the end of the year. The approximate extent was 939 acres, and total cost Rs. 5,569·82, showing a rate per acre of Rs. 5·93.

Four men were engaged throughout the year on the above surveys, one at Mullaittivu, two in the Trincomalee District, and one, Mr. Speldewinde, in the Jaffna District. This latter officer also attended to all railway surveys required and helped in the Superintendent's Office, and I would here state my indebtedness to him for his willing help at all times extended to me; his general knowledge of all old work in the Province proved of much assistance. Three application surveyors left for other Provinces during the year, but out of these two new men at once took their places.

Triangulation:—Little triangulation was done during the year. Three check points were fixed in connection with the Kadawat korale block surveys. I propose running a small chain of triangles from the principal base Kalmunai, Palativu, down the Jaffna lagoon, to Elephant Pass, early in 1903, to put the Karachchi work on the new fixing, and also to check the long main circuit traverses from Vavuniya, Jaffna, and Mandekkelar, which all meet near Paranthan. The Province is very poorly supplied with trigonometrical stations, and I would be glad to see the north-east scheme carried out for which I prospected in the early part of 1902.

Inspection.—The Acting Surveyor-General visited the Province on the 4th July, and the Surveyor-General on the 2nd December during recess. I visited the party at Vadamaradchi east on the 23rd September, just before recess, having only arrived on the 8th September.

Recess.—Recess commenced on the 3rd October. Work was much hampered by the condition of the office, which had got into a bad state of disrepair, the roof leaked all over, and a fine spray of dirty water continually fell on the plans during the rains, which were very heavy.

The plans of the Madawachchi work were all sent early in 1903, but those of the peninsula were delayed somewhat. As many of the lots were very small, considerable time was taken in computing the acreage of each lot—a duty which has fallen to the Provincial Office for the first time. During November my clerk was transferred to headquarters, and the volunteer who was trained in this office was appointed in his place.

OUTTURN, Cost, &c., of Block Surveys in each Province in 1902 from Superintendents' Reports.

Province.	No. of Lots.	Area.	Cost.	Rate per Acre.	Average Extent.
			Rs.		Acres.
Southern	6,823	70,337	43,142	·61	10
Sabaragamuwa	798	17,662	15,066	·85	22
Uva	137	12,472	7,499	·60	91
North-Western	1,032	31,464	12,924	·41	30
North-Central	1,006	70,770	20,038	·28	70
Northern	484	10,153	1,713	·17	21
Total ...	10,280	212,858	100,382	·47	21

In the six years ending December, 1902, the block parties have surveyed 1,187,225 acres, or 1,855 square miles, comprising the survey of 1,574 villages (*vide* return in Appendix).

REPORT ON TOPOGRAPHICAL SURVEYS BY MR. R. S. TEMPLETON, SUPERINTENDENT.

THE Topographical Branch in 1902 was divided into four parties. Three of them continued the 1899 surveys southward through the North-Central Province into the Central and North-Western Provinces, while the fourth completed the survey of the country between the Walawe and the Kumbukkan-aru down to the sea in the Southern Province, and then took up the survey of the Jaffna peninsula.

The staff consisted of the Superintendent, four officers in charge of parties, and twenty surveyors. During the year one surveyor was killed and one retired. Six new surveyors joined the branch, however, which brought the number of surveyors up to twenty-four. I attach a short report upon the work of each party.

As soon as I had made the necessary arrangements for the surveyors to take the field I left Ceylon on the 15th January, and went to India with a view to making myself acquainted with the methods of work adopted by the Indian Survey Department. Owing to the courtesy of Colonel Gore and the officers of his Department, I was enabled to obtain a thorough insight into the manner in which the topographical survey is carried on in that country, besides gaining much valuable information with regard to other branches of survey work, upon which I have already sent in a full report.

On my return to Ceylon in March I proceeded to Anuradhapura, which was made the headquarters of the branch during the field season. 3,065 square miles were surveyed before recess. The cost of the work being Rs. 32·14 per square mile, and considering the amount of detail mapped, the delay arising from the difficulty in obtaining a sufficient labour supply, and the inaccessibility of a large part of the country surveyed, I think that the progress made was fair and the cost moderate.

In conclusion, I beg to draw your attention to the manner in which the estimated outturn of work has been carried out. As far as I remember—I am only writing from memory—after the season of 1897, which was practically devoted to organization and experiment, it was estimated that the general outturn might be calculated on the assumption that each surveyor would complete about 100 square miles a year. The branch, containing thirty surveyors, should therefore have completed 3,000 square miles per year, or 15,000 square miles in five years. The branch has, however, seldom reached its full strength, but owing to the zeal and energy displayed by the surveyors the estimate of 100 square miles has been sufficiently exceeded to compensate for reduction in the staff from time to time owing to sickness and retirements, &c., and 15,020 square miles of country have now been surveyed by the Topographical Branch.

Recess.—Three parties in charge of Messrs. Meaden, Halliley, and Erskine recessed in Colombo. Mr. Blair's party recessed in Jaffna.

This year the procedure in recess was entirely changed. The 16-chain field sheets were drawn up in a style suitable for reduction direct to the one-mile-to-the-inch scale. This plan saved a great deal of trouble, and has given very excellent results.

The office secured at St. Kilda gave every satisfaction; the light is good, there is plenty accommodation, and its nearness to the Bambalapitiya railway station is a great convenience.

Mr. Blair's Party.—Mr. Blair took the field with six surveyors; his staff was increased by one surveyor in March, but, unfortunately Mr. de Silva was murdered by a villager. The vacancy thus caused was not filled up until August.

The object of the survey was to complete the work in the Hambantota District and continue the 1901 surveys down to the sea. This programme was carried out, 687 square miles being surveyed at a cost of Rs. 25·66 per square mile. This was the most interesting survey taken up during the season, and Mr. Blair has given an excellent account of the results obtained in his notes on the work.

The health of the party was much better than might have been expected considering the country in which the surveyors were working.

Mr. Blair and his staff left Hambantota on the 4th July, and took up the survey of the Jaffna peninsula from Elephant Pass northwards. 224 square miles of this survey were completed at a cost of Rs. 30·28 per square mile. In order that the party might continue the Jaffna survey in 1903, they recessed in the town of Jaffna, where a suitable office was obtained.

The supervision exercised by Mr. Blair was excellent considering the large area surveyed. Mr. Blair worked his party from Hambantota until July, when he shifted his headquarters to Jaffna.

Mr. Meaden's Party.—The staff consisted of Mr. Meaden and four surveyors, but it was augmented shortly after the work started by two surveyors taken from block surveys, and another surveyor taken from Mr. Erskine's party was sent to Mr. Meaden on the 1st July.

The operations in this part of the country included the survey of the game sanctuary, the eastern boundary of which was defined, where necessary, upon the ground; 930 square miles of country were surveyed at a cost of Rs. 28·64. The party suffered very severely from fever, and the greatest difficulty was experienced in keeping up the labour force.

The survey of the North-Western Province–North-Central Province boundary by Mr. Ridout and his report upon the country round about it were of the greatest use to Mr. Meaden.

The supervision exercised by Mr. Meaden was not so efficient owing to the large area taken up, the difficulty of getting about the country, and the amount of time which was taken up in fixing the work of the two new surveyors in position. Mr. Meaden made Anuradhapura his headquarters until the work extended to the Kala-oya, when he shifted his camp to Puttalam. The party were recessed in Colombo.

Mr. Halliley's Party.—Mr. Halliley took the field with five surveyors. A new surveyor was attached to the party, and had to learn his work from one of the more experienced men. One surveyor, owing to illness, did not take the field till June, and one went to England with the Coronation Contingent, and did not return until recess.

684 square miles were surveyed at a cost of Rs. 39·09 per square mile. This was the most expensive work done during the year, but there are several reasons for its being so, such as the cost of training the new surveyor, who turned out a very small amount of work compared with his expenditure, and expense of the two surveyors who only worked during a small part of the field season, but who were present during the whole of the recess. This party were surveying the country to the east of the Kumbukkan-aru river last season, and I think that the hardships which they then endured have affected their energy this season, as the majority of them are hard-working men. The principal objects of interest surveyed during the year were Mahakandalamawewa near Dambulla and a Yodi-ela running northwards from the Dambulla-oya, both of which are described in Mr. Halliley's report.

The health of the party was not good, but better than that of Mr. Meaden's staff. The supervision of the party during the early part of the year was not so good as it might have been, as Mr. Halliley had a very large amount of hill-sketching to do, so much so that the Acting Surveyor-General did not consider that he could attend properly to both it and his other duties, and the hill-sketching was therefore stopped at the Central Province boundary. The party were recessed in Colombo.

Mr. Erskine's Party.—Mr. Erskine took the field with five surveyors. One surveyor was detached from this party and sent to assist Mr. Meaden in July.

540 square miles were surveyed, costing Rs. 38·37 per square mile. The cost of the work can be to a very great extent accounted for by the immense amount of detail shown. The southern portion of the block is more suitable for block surveys than topographical work. As Mr. Erskine was quite new to topographical work and had no knowledge of hill-sketching, I had to undertake this part of his duties in addition to my own. I took every opportunity, however, for instructing him in hill-sketching, and he has made considerable progress. The only feature of any particular interest in the survey was the mapping of Siyambalangamuwa tank. There were, however, some Yodi-elas of importance at the southern end of the work.

The health of the party was very fair on the whole. The supervision of the work was very good, and he carried on his work in a very creditable manner. On my return from India I found

that he had made his headquarters at Wariyapola, which was a mistake and was the result of an over-estimate of the outturn of work. The party was recessed in Colombo.

REPORT ON TRIGONOMETRICAL SURVEYS BY MR. H. O. BARNARD, SUPERINTENDENT.

ON my return from furlough on 12th February I resumed charge of the Trigonometrical Branch. The work done during the year comprised, besides the ordinary office duties, observations taken during the early part of the year for the north-west coast triangulation, prospecting for the north-east coast secondary chain, and prospecting for the breaking down of the Ritigala-Ambokka quadrilateral, all of which are treated in detail below.

Office Work.

Owing to the want of proper assistance, the usual routine work of computing and issuing co-ordinates and bearings has absorbed an unduly large amount of the time at my disposal, and has compelled me to defer, to my regret, important lines of work, such as the re-fixing of points from existing observations, the re-computation of trigonometrical altitudes on a more accurate basis, and of the geodetical co-ordinates of points on the new fixing, &c. The requirements of the Topographical Branch and of the block surveys in those parts of the country where stations on the new fixing are still too sparsely distributed render this unavoidable at present. The steady spread of the minor triangulation will, I hope, relieve me of some of this onerous work in time. With the completion of the north-west coast scheme early in 1903, the secondary triangulation will at last be brought abreast of the immediate requirements of the Department.

The number of stations whose co-ordinates have been placed on a permanent footing since 1900 has been great enough to render it necessary to append to this report a fresh list of stations brought up to date.

Several attempts at re-computing the co-ordinates of some stations in the Eastern Province from old observations absorbed a good deal of time, and ended in failure owing to the inaccuracy of those observations.

The discrepancy in latitude at Delft between the Ceylon triangulation and the Southern Indian series led me to investigate the value of the original astronomical observations taken at Colombo in 1860, upon which the trigonometrical latitudes are based. The results have proved that these observations are to be considered only as a very rough approximation to the truth. The re-determination of this element, already recommended by Colonel Holdich in 1897, with more accurate instrumental appliances than those which are at present available, will, I hope, be undertaken next year.

Field Work.

North-West Coast Triangulation.—This triangulation forms the link between the central and the northern chains of the principal triangulation. It spreads over 2,400 square miles of country mostly covered with heavy forest and dense jungle. The difficulties encountered in this work have been dwelt upon in previous Administration Reports. It was fortunate that the early part of the year proved exceptionally favourable, and Mr. W. C. S. Ingles, assisted by Mr. G. K. Thornhill, was able to take complete sets of observations at Kudrimalai, Kumpudumalai, Mulaimalai, Issembessawagala, Arnakalu Tower, Kulataddimalai (stage), Bogahawewa (stage), Katipotakanda, and Crow's Nest (stage)—that is, at nine out of the fourteen points required—between the end of February and April, when the advent of the monsoon compelled him to cease operations. The standard of accuracy of Mr. Ingles' observations has been well maintained throughout, and I am glad to have this opportunity of placing on record my appreciation of the energy and efficiency displayed by that officer throughout the course of the work. The five remaining points will be completed in the early part of 1903.

North-East Coast Scheme.—With the exception of the northern chain of the principal triangulation, which skirts the coast from Mannar to Delft, and there forms a connection between the Ceylon and Indian triangulation, the northern portion of the Island has never been triangulated. Up to the present time there has been no pressing need for it, but the construction of the Jaffna Railway and of the large irrigation works in the Northern Province will render the accurate location

of surveys in that Province imperative in the very near future. With this in view the whole of the country referred to above was thoroughly prospected by Mr. Ingles, with the assistance of Mr. G. K. Thornhill, between April and August. The scheme comprises the erection of nineteen stages from 60 to 80 feet high at an estimated cost of Rs. 23,000. As these stages will take at least a year to build, and as the observations required can scarcely be completed in less than two years, the urgency of undertaking this work need scarcely be insisted upon. This chain of triangles will complete the secondary triangulation of the Island, and will, at the same time, connect with Colombo the pillar at Jaffna, at which an accurate determination of the longitude, by telegraph from Madras, was made by Captain (now General) J. L. Tupman, R.M.A., and the late Mr. N. R. Pogson, C.I.E., Government Astronomer at Madras, in December, 1871.

Ritigala-Ambokka Quadrilateral.—In order to satisfy the requirements of the block surveys east of Kalawewa, it has been found necessary to establish points on the new fixing in the area comprised within Ritigala, Gunner's Quoin, Ambokka, and Galgiriya. To carry out this object Mr. G. K. Thornhill prospected that part of the country between July and November. He was greatly hampered by the abnormally wet weather he experienced during that time and by continual attacks of fever due to constant exposure. In spite of this, however, he accomplished his work with great thoroughness. The observations necessary for this work will be taken in 1903 after the completion of the north-west coast scheme.

Miscellaneous.—The scope of the work which devolves on the Trigonometrical Branch has so largely increased of late that I would earnestly suggest for your consideration the advisability of providing me with skilled assistance. The character of trigonometrical work is totally different from that of other branches of the Department, and requires long and special training. Before efficient help can be expected from an assistant in such work, a certain amount of time must elapse during which his services are of little value. It is therefore highly desirable that the assistant should be appointed permanently to this Branch, and that a fair proportion of his time should be spent in this office.

REPORT ON APPLICATION SURVEYS BY MR. A. E. WACKRILL, SUPERINTENDENT.

THE average number of surveyors employed was 39, a smaller number than in 1901, but larger than in previous years. The accompanying table shows their distribution thoroughout the year :—

Application and Special Question Surveys.

Province	Number of Surveyors employed in each Month.											
	Jan.	Feb.	Mar.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.
Northern	4	4	4	4	4	4	4	3	3	2	2	1
Eastern	7	8	7	7	7	7	7	6	6	5	3	5
Southern	4	4	3	4	4	4	3	3	3	3	3	3
Western	8	7	8	8	8	7	5	5	4	5	5	3
North-Western ...	7	6	4	4	4	5	6	5	4	4	3	1
North-Central ...	3	5	5	5	5	5	2	4	3	3	2	2
Central	2	3	4	3	3	3	2	5	5	5	5	4
Uva	4	5	5	5	5	5	4	3	4	4	4	4
Sabaragamuwa ...	5	4	4	4	4	3	3	3	3	2	2	2
Total ...	44	46	44	44	44	43	36	37	35	33	29	25

The number of "fees paid" applications received during the year for attention was again in excess of former years, while the number of special questions was again largely diminished. The totals for recent years are as follows :—

	1899.	1900.	1901.	1902.
Applications	1,603	1,313	2,021	2,050
Special Questions	1,450	838	532	421
Total ...	3,053	2,151	2,553	2,471

The accompanying table shows the rate of receipt of questions from the various Provinces in the different months :—

Tables G and H (see Appendix) show the numbers of questions appearing on my registers at the beginning and end of the year, with the number received and disposed of during the year. It will be seen that the number outstanding was reduced by 630. It would have been reduced by a considerably larger number but for the pressure of work on the Preliminary Plan Registrars at the close of the year, which retarded the detail registration before despatch of a large number of plans which were otherwise ready for issue.

The accompanying summary of my monthly statements shows that the reduction of the application staff from 61 to 39 was accompanied by a corresponding reduction of the number of questions surveyed from 3,884 to 2,272. The area surveyed has, however, not been correspondingly reduced (41,047 acres to 33,465) owing to the larger average extent of questions dealt with.

Summary of Monthly Statements by Superintendent of Application and Special Question Surveys.

*Average.

The number of questions surveyed was less by 199 than the number registered for attention. This was owing to the large increase of receipts towards the close of the year concurrent with the diminution of output due to leave and recess. If the rush of fresh work continues in 1903, it can be met by the transfer of more surveyors to the Application Branch.

Table I (see Appendix) shows the number of lots surveyed by the application staff, with the area, cost, rate per acre, and average extent. To the total area might have been added an extent of about 9,000 acres surveyed upon Government Agents' requisitions, though with extended scope for departmental reasons. But as this work was done upon the lines of a block survey, it has been included under the head of Block Surveys.

REPORT OF THE ASSISTANT SURVEYOR-GENERAL, MR. P. D. WARREN, F.R.G.S.

Requirements at Headquarters.—The only addition made to the accommodation for records during the year consisted of a plan, a field book, and a store receptacle; but the erection of a new studio was sanctioned to be carried out during the current year. This will have an immense effect on the facility with which plans and maps of all kinds can be reproduced.

Block Survey Department.—The following schedule shows the issue of block survey preliminary plans to the Settlement Officer and Government Agents during the year :—

Province.	No. of Plans.	No. of Lots.	Extent. Acres.
Western	2	439	1,387
Southern	43	2,507	41,101
North-Central	19	149	10,162
Uva	37	820	15,429
Sabaragamuwa ...	13	896	29,254
Total ...	114	4,811	97,333

making a total issued of such plans since the institution of block surveys in 1897 of 277,780 acres in 299 preliminary plans, containing 16,448 lots. About one-third of the total issues of preliminary plans are thus credited to 1902, showing that the new system adopted and the experience gained in the class of work is bearing fruit. When this work was first instituted it was considered that all work required subsequent to the actual drawing up of the field plans, such as preparing tracings for reproduction by contact printing, or photo reductions, computations, and such like, could be carried out in the Head Office *pari passu* with the works usually performed here; but we suddenly became overloaded with application and general miscellaneous work, so that the block survey preliminary plan issues proceeded at a very slow rate. Clearly, something had to be done to remove the rapidly increasing bulk of these plans in the office, and to enable Settlement and Revenue Officers to take early advantage of the valuable work being done in the field. In the 1902 recess it was therefore decided to compute the surveys and have complete tracings of all field plans made by the surveyors before they were sent into headquarters. This enabled us to deal with the photo reductions from 8-chain to 16-chain scale rapidly, but the old title plans had to be placed in position and all lots affected re-computed and tenement sheets amended to enable us to issue plans suitable for settlement purposes on the scale of 16 chains to an inch. It was, however, soon evident that, though the method was an improvement; the Head Office would not be able to catch up the field, presuming that the same amount of other work is always coming in, so a further modification in the duties of the field staff in recess was decided on. Plans are now sent to headquarters with all their title plans laid in position, every lot computed, tenements written on tracing cloth ready for printing by ferro-gallic, and tracings of the complete field plans drawn on paper for the purposes of reduction to half scale by photography or reproduction by ferro-gallic and Vandyke processes. The issue of plans and tenements to Settlement Officer, reductions to scales suitable for publication, and the permanent printing to full size for field use of these surveys are all thus enormously expedited, so that with the facilities for reproduction that are about to be provided, and which are noticed below in their proper place, I am confident in being able, not only to overtake all arrears of preliminary plans within a reasonable period, but afterwards to keep pace with the field staff, while at the same time carrying on the reproduction and publication of the sheets sent in.

I have devoted some space to the subject of block survey preliminary plans in order that the position of affairs may be properly understood, but it must not be thought that I thereby dealt with all the duties that fall upon this branch. The work to be done for the Settlement Officer is naturally heavy, and consisted last year in the supply of (*a*) schedules of titles in seventeen villages, (*b*) ten uncoloured tracings of villages, (*c*) statements of lands alienated by the Crown, (*d*) certified plans to be filed in reference cases, (*e*) seventy "sketches" of lots for notices, (*f*) checking 664 "sketches" supplied by the Settlement Officer, (*g*) sixteen tracings (in duplicate) showing settlements effected, and other miscellaneous work. For the purposes of Waste Lands Ordinances the Government Agents of the Western, Southern, Sabaragamuwa, and North-Central Provinces have been supplied with numerous tracings and sketches, which it would be useless to detail here. The total results of the above-mentioned works are detailed in Appendix K. This department is also in charge of miscellaneous work required within the Municipality of Colombo, but this class of work during the year, though requiring very careful attention, has not been heavy. The Registrar-General was supplied with 140 certificate and registration plans.

The Record Map Department was seriously blocked with work at the commencement of the year, but it was all satisfactorily disposed of before the end of the year, besides current work being kept well up to date. All surveys of lands for sale, settlement, acquisition, or for any other purposes are here examined and inserted on record sheets; 9,742 separate lots were thus located.

Under the system then in use tracings of the 16-chain photo reductions of all block surveys had to get the title plan boundaries inserted on them from the record maps, and 58 such tracings were dealt with. This has proved to be a very tedious work, besides requiring great care, and will not be necessary in future, as the title plans will be inserted on the 8-chain sheets before the reductions are made.

Data were compiled for the new Manual of Ceylon regarding the watersheds of the principal rivers, 28 old 16-chain plans were brought up to date for Government, and information of various kinds was supplied to the Superintendent of Census, the General Manager of Railways, the Director of Irrigation, &c.

Preliminary Plan Department.—Preliminary plans to the number of 1,658 in 8,553 lots for 36,085 acres were issued to Government Agents during the year, being 11 plans in excess of last year; 126 plans in 933 lots for 357½ acres for acquisition of lands were forwarded to the Colonial Secretary. 503 old preliminary plans were amended in connection with new surveys, and 114 copies of preliminary plans were issued to Government Agents and other officials.

For the purposes of the Waste Lands Ordinances 179 tracings were supplied to the Settlement Officer and Government Agents, while 56 tracings were amended. Thirty-eight "true copies" of licensed surveyors' plans were supplied to Government Agents and three to the Settlement Officer.

The work of examining notices of land sales and registering land sale returns continues to be very heavy; in all 685 notices for 24,309 lots were examined, and 301 lots were struck off for various reasons. This shows an increase of 127 notices and 6,794 lots in excess of the work done in 1901.

The following schedule shows the details of land sale notices in each Province examined during 1902 :—

Province.	No. of Notices.	No. of Lots.	No. of Lots struck off.
Western	144	6,921	135
Sabaragamuwa	51	1,363	27
North-Central	58	1,346	4
Central	80	575	5
Uva	62	2,179	1
North-Western	105	2,089	2
Northern	33	1,005	19
Southern	109	5,661	86
Eastern	43	3,170	22
Total ...	685	24,309	301

Title Plan Department.—The returns of title plans issued again show a considerable increase over the previous year, which held the record for numbers, which is the actual test of the work performed. For 1902 we have a total issue, as per Appendix D, of 6,774 sets, against 6,286 in 1901, a difference of 488. The greatest number issued was again in the Western Province, with the Southern Province again a good second. The average extents of the lots for which title plans were issued show a slight increase over the figures for 1901, being 5 acres against $4\frac{2}{3}$, which is accounted for by the average for Sabaragamuwa being nearly 95 acres for 142 title plans.

Appendix F gives the usual comparative statement of issues, revenue, and departmental expenditure (which last has really nothing to do with it now) from 1833 to date.

Process Work.—It has been customary to deal with this branch of the Department under two separate heads, as if the printing branch had nothing to do with the studio, but their duties are now so intertwined that I prefer to consider the whole under the above heading.

The outturn of ferro-gallic prints for the first time fails to show an increase on previous records, the total for 1902 being 9,427, against 10,179 for 1901 of plans of all sorts, but the abnormally wet weather in the latter months of the year is probably accountable for this, as fine weather and bright sun are necessary for the rapid and satisfactory production of prints. The following schedule shows the yearly outturn since the process came into use :—

Year.	Prints.	Year.	Prints.
1891	217	1897	4,401
1892	503	1898	6,259
1893	499	1899	6,819
1894	918	1900	7,453
1895	2,196	1901	10,179
1896	2,052	1902	9,427

Photography now occupies a most important position in the reproduction of survey plans. 179 negatives were made of 16-chain reductions of 8-chain block survey plans, and 104 one-mile negatives of topographical surveys; other work brings the total up to 365. Considerable advantage has been taken of what is known as the "Turner process" for direct printing on zinc from the negative; 60 block survey and 50 topographical plates were prepared by it. A start was also made with the "Vandyke process," but owing to want of experience, very poor accommodation, and bad weather, only 31 plates were produced from original tracings of block surveys. "Vandyke" is undoubtedly the process of the future for the reproduction of block survey plans; by it plans will be printed, exact facsimiles of those received from the field, and will be used as preliminary plans for Waste Lands Ordinances or Government Agents' settlements or land sales, and for actual field sheets for new work required to be inserted within the block survey area. Some of the plans printed in 1902 were from bicromated Husnick's paper, but this method will never more be adopted when it can be avoided, as "Turner" ensures the printing ink having a firm contact with the zinc or stone, and of course precludes all possibility of the expansion and contraction unavoidable in the use of paper transfers.

Plates on both the Turner and Vandyke processes are developed in the studio and gummed up; they are then sent to the printing room, where they are etched immediately before being printed. The final etching at times shows the plate to be unsatisfactory when it has been sent back to the studio for another transfer, but all difficulties are now being overcome as the workers become more adept at manipulating the plates. To ensure success great care is required at every step, and it is only because those in charge of the various branches take a personal interest in their special duties that I have been able to obtain the results already produced.

The outturn from the printing room was as follows :—

Colonial Secretary	12,173
Archæological Commissioner	3,100
Other	1,500
Survey	7,580
Spare copies	5,100
Surveyor-General's Report	5,650
One-mile-to-an-inch maps	1,190
16-chain diagrams	560
Blue prints for photo reductions	650
Total ...	37,503

This total is thirteen in advance of total for 1901, but no schedule of this description can give an adequate idea of the real amount of work actually accomplished. Most of lithographs and zincographs are now printed in colours requiring from two to six registers. Each register requires more time and labour than an ordinary print in black. The draughtsmen attached to the room have also to prepare the colour-stones, or plates, besides numerous hand-drawn transfers, some of an intricate nature. The actual printing done was equivalent to 64,893 copies or pulls.

The wet weather caused considerable difficulty in the registration of colour prints owing to the contraction and expansion of the paper, and caused considerable loss of time. Paper is always a source of trouble to the process worker, but when, in addition to its well-known eccentricities, or perhaps I should say its unknowable eccentricities, sudden changes in the humidity of the atmosphere have to be contended with, accurate register becomes a matter of practical impossibility, and it is best to take up purely black prints, in which accuracy of scale is not of the first importance, till such time as the elements are more propitious.

A guilotine paper-cutting machine was added to the equipment early in the year, and has been of great value in cutting up the large amount of paper consumed; it is impossible to estimate the time saved by such a machine; the accuracy and neatness with which the work is performed in comparison to hand-cutting is a great feature in its favour.

It is with great satisfaction that I look forward to the erection of a new studio where the Vandyke and Turner processes can be carried on in a proper manner and without interfering with the development of negatives; the present small studio and dark room are quite unsuited to present requirements. With adequate accommodation for the preparation of plates, supplemented by a printing machine to take double-elephant paper, driven, together with the three presses now in use, by an electric motor, we can look forward to being able in the near future to turn out work both up to date and expeditiously. The gas engine that has been used for the motor power for the last five years has been giving a good deal of trouble, and wastes at least two or three days every month, besides being noisy and dirty and occupying a lot of valuable space.

Miscellaneous Department.—Pressure in other branches has prevented me from keeping up a large staff here, but still the demands of the public for copies of maps and plans have, on the whole, been promptly attended to. Besides issues to officials free of charge, which reached a total of 2,323 diagrams, &c., against 885 issued in 1901, 902 were issued to the public, for which Rs. 3,361·49 were recovered and 162 were issued departmentally.

Field Sheet Department.—During the year 5,849 field sheets were issued on 1,672 requisitions, while 6,175 were received into the office; this entailed the handling of 3,357 tin cases. The system that will be introduced as the printing of block survey sheets proceeds will in time materially reduce the work of sending out old application field sheets, and thus save the wear and tear to these valuable documents, which under the ordinary application survey system is rapidly affecting their efficiency.

Instrument repairing.—The workshop equipment has received some attention during the year, and though not yet complete, we have been enabled to do a lot of useful work. Two 4-inch theodolites, which had their vertical axis damaged by falls, were put into an efficient condition. Parallel plate screws were fitted and other repairs effected to five 5-inch theodolities. Several steel tapes were repaired; various works were completed to a standard barometer, aneroid, anemometer, anemograph, pluviograph, thermograph, and barograph, and kept in working order. The instrument repairer is now in a position to carry out all ordinary repairs to theodolities, and I hope it will soon be difficult to say what work he cannot do. Besides such jobs, all the brass fittings for a camera obscura for plan reduction, two sets of fitting for new printing frames, three sets for duplicate frames, and many other works were attended to.

APPENDIX.

STAFF.

1st January	...	Mr. G. E. Leembruggen seconded for Harbour Works.
17th February	...	Mr. H. O. Barnard returned from leave.
11th April	...	Mr. J. B. M. Ridout on leave.
1st July	...	Mr. A. H. G. Dawson on leave.
4th August	...	Surveyor-General returned from leave.
8th September	...	Mr. R. B. Campbell retired from Service.
15th September	...	Mr. A. J. Wickwar on leave.
19th November	...	Mr. E. Ohlmus, Chief Clerk, retired from Service.
29th November	...	Mr. L. Shipton returned from leave.

NOTES on Topographical Survey of Kandapalle Division of Province of Uva and Magam Pattuwa of Southern Province by Mr. Dyson Blair, Assistant Superintendent.

THIS country covers 1,500 square miles between the Haputale hills and the sea, and forms part of the ancient Sinhalese Province of Rohana. It rises gently from sea level to 500 feet, though some peaks and ranges in it rise to 1,000 feet and higher. It is covered for the most part by jungle having little good timber in it, and part of it claimed by the Kataragama temple has been entirely destroyed by chenaing. Great blocks are felled in that claim every season, and thousands of promising young satinwood and halmilla trees are sacrificed for a few bushels of grain once in eight or ten years. Some good timber was seen in the valley of the Mau-ara below Hambegamuwa, and again between the Yala and Kumbukkan rivers in Uva, a block which for centuries has been uninhabited. Along the rivers, too, there are always strips of high forest, the large kumbuk trees especially, which overhang the river beds and tower above the other trees, being the most prominent. From a hill-top the course of the rivers can be traced for miles by those trees.

The block in question is watered by four perennial rivers: the Walawe, Menik, Kirindi, and Kumbukkan, but the second and third go nearly dry in dry seasons, the waters of the Kirindi barely sufficing for the Tissamaharama irrigation works in August.

There is every indication that this country, only one two-hundredth part (5,000 acres) of which is now cultivated, was once as densely populated and highly cultivated as any other part of the Island. In the 1,500 square miles over 1,500 tanks have been located, averaging about one tank for every 600 acres of land, and yet there are probably scores of small tanks still lost in the jungles. Besides these, elaborate series of channels from anicuts on the large rivers have been brought to light, enough to prove that not much but flood water ever reached the sea.

Channels of the Walawe-ganga.—One of these, on the Walawe river, begins about a quarter of a mile above the modern Uggalkaltota anicut, and after a course of over 3 miles it crosses the Weli-oya, a swift-flowing stream with a width of about 150 feet. It then follows the bank of the river down to Kotaviheramankada village, and then a tortuous course of 4 miles, where it was lost, but after a gap of a mile it was found and traced for another mile, and then finally lost a mile north of Bambarapelessa village, after a total course of over 10 miles. Its bed is 40 to 50 feet wide, and its embankment must have been a great earthwork, though parts of it now are barely visible. It is said to have taken water into Hambegamuwa tank, but that is scarcely probable, as that tank has an ample drainage area of its own. The very fact of this channel crossing the Weli-oya proves that it must have been one of the largest on the Walawe, for the Weli-oya, even in the driest seasons, carries a considerable body of water from the hills above Haputale, and yet it has apparently been insufficient for the purposes of this channel.

The second channel on the Walawe was found near the Weli-oya, three-quarters of a mile above its junction with the Walawe, but it is almost certain that this also took off from the latter and crossed the former. Masonry of a bridge probably was found on this channel a hundred yards from the junction of the streams. After being followed for about 5 miles this channel was lost at a point close to that at which the upper channel was lost. I believe that the dry weather flow of the Walawe was not allowed to go along its bed to be lost by absorption in its sands, but was carried by this channel in a course parallel to that of the river, and that the land *above* it was irrigated from it by branch

high-level channels. At any rate, 2 miles below Bambarapelessa village, and only a few yards from the river, but 30 or 40 feet above its bed, a channel was picked up again (evidently the same channel) and followed down for 2 miles to where a high-level channel leaves it and leads to Sinnuggala tank, which now depends upon its own catchment area for its supply.

The low-level channel was traced for another 2 miles and was lost near Timbirigahamankada village. From this point there is a gap of 8 miles, but the villagers affirm that a channel exists, though not one of them could point it out. The next part was found close to the river again, where it is joined (on the other bank) by the Rakwana-ganga. From this point it was followed, without a break, along a winding course, with slow fall for 14 miles (direct distance 6 miles), where it enters Pandikulam, a considerable tank, to which I shall allude hereafter. From the sluice of this tank the channel begins again, and was followed for 9 miles to the Aliolu-ara, where it was lost. Local legend has it that this channel took water to Hambantota, but, except that the levels show that it was possible, there is no other proof of this.

The next channel on the Walawe was found just above the modern Liyangahatota anicut, and was followed for 5 miles, 4 of which have been adopted as the course of the proposed channel from the new anicut to Koggala tank.

The last channel found on the left bank of the Walawe river takes off at the Karagaha-ara mouth, 5 miles above Ambalantota, and was traced for about 2½ miles. It is only about 20 feet wide, and was intended for the irrigation of what is now the Kariwila Plain.

Channels on the Kirindi River.—Only three short channels were found on the Kirindi-oya. Above Wellawaya there are fields cultivated now by a channel from it, but it is a comparatively modern work. No ancient channel was found until just 2 miles above the present Elagalla anicut at a rocky part of the stream. No trace of the anicut was to be found, but a channel starts there on the right bank, and was traced for 2½ miles, till it crossed the Hambantota-Wellawaya road at the 17½ milestone, after which it has a natural fall into the Wirawila-ara and so to the present Wirawila tank, which is really a portion of the ancient Yodiwewa, to which I shall allude again.

One and a quarter mile below the present Elagalla anicut another old channel was found on the left bank, starting at the ruins of an old anicut of hewn stones, some of which were used in the construction of the present anicut. This channel was intended to supply Tissamaharama and the connected works, and it has been superseded by the new channel. The last channel on the Kirindi was found 2 miles below this and a mile above the Kirindi bridge. It starts on the left bank at the ruins of an anicut, some of the hewn stones of which are still visible, and it was traced for about 2½ miles, until it enters the existing Tissamaharama fields.

Channels on the Menik-ganga.—The Menik-ganga, rising in the Passara hills, carries almost as much water as the Kirindi. To-day, excepting a few hundred acres at Horabokka, Pelwatta, and Buttale, it flows unused to the sea. It is certain that formerly none of its water was wasted, though none of its large channels were found.

An anicut was seen on it above the Anguna-ara mouth. Too late last year a man was found who said he could point out a channel which led from this anicut down to Kataragama. On going to survey it this year it was found that the man had died, and no one else seemed to know anything about this channel.

The next channel on the Menik was surveyed, beginning at an anicut 4 miles below Kataragama, and after a course of 2½ miles on the right bank it falls into Katagamuwa tank, which even now covers 320 acres, though only 18 acres are cultivated under it.

The last channel on the Menik is on the left bank of the river, and begins at a ruined anicut about a mile above. It was surveyed for 2 miles down to the great plains of Yala, which were undoubtedly once rice fields irrigated by this channel.

Channels on the Kumbukkan River.—The whole country from Buttale to the sea and between the Kumbukkan and the Menik rivers has been uninhabited and untouched by that timber destroyer, the chena cultivator, but the number of tanks in it and the number of anicuts in, and scraps of channels along, both banks of the Kumbukkan prove that it was not always so.

One of the most important channels on the right bank, and one hitherto unknown, starts at the ruins of an anicut at Mahaweltota. It was followed without a break from there for 8 miles, where it enters Mandagala tank, which will be described later. A mile below the Mahaweltota anicut there is another, from which a channel on the left bank led across the Alagola-aru into Bakmiwewa and probably also to Alutgamawewa, though the latter section was not found.

Five miles from the coast another anicut called the Kudagalamuna was located, but no channel from it on either bank was found. It may have been superseded by the Mahagalamuna, three-quarters of a mile further down. From this anicut a channel was surveyed for one mile till it entered Kumana tank, which is still used by the Kumana villagers, though it now depends upon its own small drainage area for its supply.

Kolongastenna Channel, another small channel, though not under any great river, is worthy of notice. It starts above Kolongastenna from the Pussella-aru, which rises in Roeberry estate. The anicut was probably of a temporary nature, made of timber laid across stone pillars sunk into holes drilled in the rocky bed of the stream. The channel from it has a 6-foot bed, and was surveyed for 2 miles to where it leaves the basin of the Pussella-aru, and has a natural fall into the Budurugala-aru, which flows into the Kirindi-oya, crossing the road to Hambantota 3½ miles from Wellawaya. It would not be a difficult work to restore, and land could be taken up under it beginning on the high road.

Tanks.—Of the 1,500 tanks mapped, there are probably not twenty which covered more than 200 acres, and it is the most important of these that are worthy of notice.

Hambegamuwa Tank.—Hambegamuwa is an ancient tank recently restored. It covers an area of 400 acres, but at present only 100 acres are cultivated under it. It is filled by the head waters of the Mau-ara. Its drainage area of 20 square miles is sufficient to fill a much larger tank twice a year.

Pandikulam Tank.—On the same stream, but 18 miles further down, near its junction with the Walawe river, there are the remains of a great tank called Pandikulam. A tradition asserts that it held the waters of a thousand small tanks. As a matter of fact 440 tanks were found in its drainage

area of 142 square miles, which includes that of Hambegamuwa. It is sufficient to fill the largest tank in the Island, and yet it has evidently been insufficient for the land irrigated under it, as its own catchment area was supplemented by a perennial supply taken from the Walawe by a channel already described. The actual bund of this tank is only about 1 mile long, but it is difficult to distinguish it from the natural ridge, which forms a part of it. The only serious breach in it is where the Mau-aru flows through. The bund is 25 feet high near that point. The tank probably had a head of water of about 20 feet, and cannot have submerged less than 1,500 acres, the present tank of Magama and its field being in the bed of the old tank. Near the east end of the bund, and close to the Magama village, there is a "bisakotuwa" in fine order, and here the main outlet channel left the tank. It was traced for 9 miles towards Koggala.

Koggala Tank.—The present tank at Koggala is a comparatively modern work, and though its head of water is only about 5 feet, it covers 300 acres, forming part of the old field irrigated under the old tank called Koggala Kadalawewa. The latter had an 8-foot bund, which was over 50 chains long, but this is really only one tank of a series of over forty tanks which held the waters of the Maha-ara. The drainage area of the whole scheme, including that of the present Koggala tank, is about 30 square miles.

Badagiriya Tank.—One of the finest old works in the Magam pattu is the tank called Badagiriya, 8 miles out of Hambantota. A bund 130 chains long and rising to 25 feet high crosses the valley of the Mallala-aru, an important stream rising in the Dewagiriya hills 20 miles to the north. The drainage area of this is 135 square miles, in which there are 330 minor tanks, and it must have submerged an area of 2,000 acres with a head of water of about 20 feet. Landejulana and Alutwewa villages are in its bed, and Gonnoruwa is said to be just out of it. There are only three bad breaches in the bund, one made by the Tammanna-aru and two by the Mallala-aru. The Badagiriya rock, whence the tank takes its name, forms a part of the bund. The spills are at a natural slab rock in the middle of the bund, and the only other outlet was found at the south-west end of the bund, where a channel begins. This was traced for a mile and a half towards Hambantota. This work, if restored, would be one of the finest in the district, and the 2,000 acres of excellent land under it would be eagerly bought. Besides this, it would form a reservoir from which water could be taken into Hambantota, a town with a population of 3,000, which depends now upon half a dozen brackish wells for its sole supply.

Maha Ranawaranawewa.—If an extension of this scheme ever became necessary, the restoration of works further up the river could be undertaken. Ten miles higher up, at Maha Ranawaranawewa, the Mallala-aru was again dammed by a bund rising to over 20 feet high and nearly three-quarters of a mile long. This has only two breaches in it made by the Mallala-aru, each about 1 chain wide. At the south end of the bund a double row of stone pillars was found, the remains of either a bridge or of a "kalingula," by means of which the spill level could be altered. This tank covered probably about 300 acres, and had a head of water of about 18 feet. If restored it would form an important upper reservoir, from which Badagiriya tank could be supplied when the latter ran low. A channel was traced for half a mile from Maha Ranawarana, and it is said to have supplied the present Ranawarana.

Tissamaharama; Debarawewa.—The Tissamaharama irrigation works, as enlarged this year, form one of the most important schemes in operation. Tissawewa itself, with the bund raised, will cover about 600 acres, supplied from the Kirindi river by the Elagalla channel. Debarawewa, another tank under the same channel, covers 140 acres, and the two tanks together now irrigate 2,450 acres of land, over 2,000 of which is paddy.

Sittarawila and Yodiyakandiya.—Sittarawila and Yodiyakandiya together form really one sheet of water, for the bund of the latter is now being raised, and the low bund separating them will be submerged. Together they cover 1,070 acres, and are filled by the spill channel and the superfluous water of the high-level channel from Tissawewa. In addition to this, they have a drainage area of their own of 15 square miles. An area of 1,170 acres is cultivated under this tank, 1,000 acres of which is under paddy.

Yodawewa.—Close to Tissawewa, but on the right bank of the Kirindi, an ancient tank called Yodawewa was surveyed. It has a bund 1½ mile long and rising to a height of 15 feet. The present Wirawila tank, covering 365 acres, forms the upper half of Yodiwewa, which covered about 800 acres. It has a drainage area of about 27 square miles, but this was supplemented by a channel from an anicut in the Kirindi river above the modern Elagalla anicut.

Atturumitturuwewa. — In the heart of the game sanctuary a considerable tank called Atturumitturuwewa was surveyed. It has a bund 60 chains long and rising to a height of 25 feet above the bed of the Atturumitturu-aru, which breaches it in two places. At the west end of the bund the earthwork gives place to solid stonework, the stones being 7 feet by 1½ foot. Three separate spills were found here, two in the bund and one cut out of the natural high ground and paved and faced with the large stones, many of which were found *inside* the tank, as if the destruction of the tank had been the work of man. This tank has a drainage area of 27 square miles, and when it was restored it probably covered about 700 acres.

Mandagala Tank.—Another large tank in the game sanctuary is Mandagalawewa, the north end of the bund of which comes within three-quarters of a mile of the Kumbukkan river. Its bund is over 1¾ mile long and rises to a height of over 20 feet, and has only one breach in it. Its own drainage area is small, but it was built as a reservoir under the channel from the Kumbukkan river, already described. It must have covered about 1,200 acres, an area which is still marked by open park country. Near the south end of the bund a sluice and "bisakotuwa" were found, all in perfect order. The latter is placed in this case right in the centre of the bund, and is 10 feet by 10 feet and 15 feet deep. The outlet pipes are a pair, each 2½ feet by 2½ feet. The top stone of the "bisakotuwa" facing the outlet has two lines on it carved in "Nagara" letters. The spill, which is at the extreme end of the bund, is also in good order, and is a substantial piece of work with solid stone facing. Open park lands under this tank would seem to indicate how extensive were the lands irrigated under this tank.

Game Sanctuary.—The game sanctuary in the extreme end of the Southern Province has an area of 130 square miles, lying between the Menik and Kumbukkan rivers, and forms one corner of the great uninhabited block lying between Buttale and the sea. This, by the way, is the largest uninhabited area in the Island, extending, as it does, over 1,000 square miles. As the inland boundary of the sanctuary is remote from paths and villages, it is for all practical purposes of much greater area than that proclaimed. The benefit of this reserve is becoming more apparent every year, and one who has known it for the last forty years says that he has never seen game so plentiful.

Travelling from Yala a herd of about fifty buffaloes were seen grazing on the Yala plains ; and the same evening, from the camp at Pahala Pottane, a dozen different herds of spotted deer, each of from six to twenty head, were noticed at the same moment in the open, while next morning a herd of over a hundred wild pigs were seen leisurely travelling from the lewaya, where they had wallowed all night, to the inland scrub. The grass on the plains of Yala and Pottane is of a fine quality for grazing, and seems to grow luxuriantly, even in the dry months, when grass elsewhere has died down. Another herd of about fifty buffaloes graze in the Pottane plains, and haunt the valley of the Atturumitturu-aru, while many sambur were seen in the deeper forests.

The tameness of all the animals was most remarkable. The buffaloes were approached on horseback within fifty yards before the herd broke and ran, and even among deer their curiosity overcame their fear at sight of human intruder. Elephants were not so numerous in the reserve as they are in some other parts of the Island, but the open forest is not congenial to them, and they are in greater numbers in the high forest further inland.

Hitherto the water supply in the game sanctuary gave out by August, and the animals crowded to the boundary rivers, where great numbers, especially on the Kumbukkan, were illicitly slaughtered. Now, however, small tanks within the reserve are being deepened and restored to retain a supply all the year.

Salt Lakes.—A characteristic feature on the south-east coast of the Island is the number of "lewayas" or natural salt lakes. A considerable part of this coast was once under the sea, for comparatively recent shell deposits are to be seen 4 or 5 miles inland and 20 or 30 feet above sea level. A sand bar has been thrown up by the waves leaving those salt lakes separate. Their beds are below sea level, and the salt water enters them by percolating through the bar, or breaking over it in stormy weather. There are twenty-five of these "lewayas" between Ambalantota and the Kumbukkan river, and they vary in extent from a few acres to over a thousand acres. Some of these, such as the Mallala lewaya (1,120 acres) and the Karagan-aru lewaya (896 acres), have a large drainage area, and on these the formation of salt is of rare occurrence. The best for this purpose are the Maha lewaya (460 acres), the Koholankela lewaya (550 acres), the Embilikala lewaya (590 acres), the Budala lewaya (900 acres), Kirindi lewaya (50 acres), Palatupana Maha lewaya (320 acres), and the Palatupana Goda lewaya (180 acres). When salt forms on the Uda Pottane and Pahala Pottane lewayas it is destroyed, as they are far removed from a labour supply, and the transport cost would be too great. At Pitawatamodara, near Hambantota, a "wave-trap" has been tentatively constructed, by means of which the supply of sea water is increased and controlled. The waves break on a sloping ramp, and rushing up the incline fall over a sill into a channel, from which there is a fall of over 4 feet to the centre of the Maha and Koholankela lewayas. This work is one well worth doing in a permanent manner, and the ramp should be extended in a curve round the bay for about 200 feet, for at the apex it was noticed that the waves rose to 6 and 8 feet above sea level. When enough sea water has entered the lewaya, it is only necessary to block the channel near the sill. There is no reason why there should not be several salt harvests in one year by means of this arrangement, and one year's results would pay for the whole cost of the "wave-trap."

Archæology.—Though every lonely hill is capped by a ruined dagoba, and rock caves were found in scores throughout the block, there were no very extensive ruins noticed. The principal ruins were seen at—

Arambekema, 2 miles east of Hambegamuwa. A bare rock 150 feet high, with eight ruins of pansalas and monasteries and several fine rock water-holes, one of which was formerly roofed in.

Veragala, 1 mile south of Bodagama, near Tanamalwila. Dagobas, ruins, and a rock inscription in Asoka letters, the latter being barely decipherable.

Digaramavihera, near the Sittarama ford on the Kirindi river. A dagoba in ruins. The bricks 16 in. by 9 in. by 3 in. marked ᵬ, and bricks 16 in. by 10 in. by 4 in. marked 𑀧 and 𑀨.

Beraliyahela, 5 miles north of Tissawewa. A monolithic image of a sitting Buddha in a rock cave on the summit. Bricks 10 in. by 8 in. by 2 in. found near it.

Mau-ara, near the source, north of Balaharuwa. Strange bass relief on solid rock of four footprints of the right foot pointing in the four cardinal directions.

Ellalawatta.—Stairway up the rock. Dagobas in ruins, and rock water-holes and baths.

Tissamaharama.—Four large dagobas, two of which have been recently restored. Ruins around the dagobas.

Kataragama.—Temples still occupied. Dharma Salawa and Kirivehera with stone image of King Duttha Gamana, 160 B.C. There are very few ruins to mark the site of the city in which Lokissera reigned in the eleventh century.

Situlpahuiwa, 3 miles east of Katagamuwa. Dagobas, rock water-holes, and many ancient rock caves, in one of which is a large image of Buddha prone.

Muduvihera, 2 miles north of Palatupana. Dagobas and caves.

Ritagala and Jamburagala, 3 miles north-east of Palutupana. Scattered rock caves and rock water-holes.

Fortress.—Four miles south-east of Palatupana is the site of the fortress built by Vijaya Bahu to repel the Tamil invaders. A great battle was fought here in the eleventh century, in which the Sinhalese sub-king was victorious.

Patanagala, on the coast between Palatupana and Yala. Ancient inscription on the rock in Asoka characters, but some of the letters are not shown on Professor Müller's alphabet.

Mandagala.—Nagara inscription on the bisakotuwa of the tank. There is also a rock cave on the hill, in a fine state of preservation, like those on Gunner's Quoin.

Mayagalavehera, 9 miles east of Kataragama. Dagoba and ruins. Copper coins of 1800 were found here with a clear representation of an elephant on one side and the number "192" on the obverse.

Patahapudumagala, 2 miles east of Mayagala. Several dagobas and ruins.

Yahangala and Badagiriya, 10 miles north-east of Hambantota. Dagobas, ruins, and rock steps. Dutch copper coins of 1743 and 1756 were found among the *débris* of the dagobas on both of the rocks.

Minerals.—The geological features of the block are rather monotonous, gneiss being the most predominant. Great smooth round bosses of it, from 50 to 500 feet high, protrude from the plains, giving the landscape its characteristic appearance. The ancient cave dwellings are in hollows under those rocks. Along the Haputale foothills there is more variety in the rock formations, and some of the minerals found there are worthy of notice.

Springs.—Several iron springs were met issuing from the foot of the Kolongastenna hills, where great beds of limonite were found. At Bopathkeula a small rice field is irrigated by one of these springs, the water of which is strongly impregnated with iron sulphate, and in the channel below it are brilliant curdy deposits of the hydrated sesqui-oxide.

Hot Spring.—The only hot spring in the block was seen at Maha Pelessa in the bed of the Maha Kadawala-ara, 5 miles north-west of Koggala in the Magam pattu. It has a temperature of 113° F., and is perfectly clear, but is strongly impregnated with salt. A slight odour of sulphuretted hydrogen was noticed, but that was probably due to the decaying leaves in the mouth of the spring, which is evidently a favourite bathing-place for elephants.

The following is a list of the minerals collected in the block :—

(1) *Limonite* found in great thick beds in the hills above Kolongastenna. It contains 30 per cent. by weight of iron.

(2) *Limonite* (Peal Iron Ore).—In horizontal gravel deposits and loose conglomerate along the coast between Hambantota and Palatupana. Ancient iron workings were seen between Balaharuwa and Alutwela in Wellawaya korale and near Tissa.

(3) *Limonite* (Brown Ochre).—From the iron springs around Kolongastenna and in the valley of the Pussella-ara.

(4) *Magnetite.*—Loose fragments only in gneiss and in minute grains in many of the rivers.

(5) *Plumbago.*—At Balaharuwa and in the hills below Koslanda.

(6) *Mica.*—Slabs of over a foot square were seen round about Patinigolla, and it is reported that this was mined some years ago near the Weli-oya.

(7) *Talc.*—At the Public Works Department gravel quarries near Kirindi.

(8) *Kaolin.*—In the hills near Patinigolla. It is of an oatmeal consistency, the feldspar not being perfectly decomposed, but after sifting it could be used for pottery manufacture.

(9) *Rock Crystal.*—Common everywhere.

(10) *Chalcedony* (Agate).—At Katagamuwa.

(11) *Spinel Ruby.*—Between Katagamuwa and Palatupana.

Corundum, white sapphire, garnet, spinel, and tourmaline were found in the beds of the Kuda-oya, Kirindi, and Menik rivers.

Surveyor-General's Office,
June, 1903.

H. O. BARNARD,
Supt. Trig. Surveys.

IRRIGATION.

REPORT OF THE DIRECTOR OF IRRIGATION FOR 1902.

EXPENDITURE.

THE total expenditure for the year was Rs. 779,714·64, and the services to which it was appropriated, as compared with the two previous years, were as follows :—

	1900. Rs. c.	1901. Rs. c.	1902. Rs. c.
Works of survey and investigation ...	21,594 1	29,811 30	24,038 66
Works of construction ...	199,417 62	390,194 42	381,247 18
Minor works and repairs ...	54,724 16	40,201 71	48,527 41
Works of maintenance ...	74,556 16	68,502 7	76,806 10
Establishment: salaries and allowances... ...	132,093 35	207,164 68	219,805 83
Miscellaneous: tools, instruments, &c.	21,639 51	31,971 5	29,289 46
Total ...	504,024 81	767,845 23*	779,714 64

* This is the correct expenditure ; the amount shown in last report was Rs. 766,594·68, being Rs. 1,250·55 less under the head Establishment. (*Vide* Central Irrigation Board Report, 1901.)

WORKS OF SURVEY AND INVESTIGATION.

2. The expenditure under this head was distributed as follows :—

	Rs. c.
Northern Province.	
Vavunikkulam	2,842 53
Channel connecting Mahagalkadawala with Pavatkulam	3,495 49
Akattimurippu scheme	660 45
North-Central Province.	
Nachchaduwa, Maha Kanadarawa, and connected works	3,866 96
Eastern Province.	
Pattipolai-aru scheme	841 45
Surveys in Panama pattu ...	529 65
Anicuts in connection with Manalputtyaar scheme	311 77
North-Western Province.	
Mi-oya scheme	5,243 16
Tinipitiyawewa	180 12
Land under Pandawewa... ...	1,827 99
Southern Province.	
Kirinde-oya scheme, right bank ...	2,222 19
Walawe-ganga scheme, left bank, Magam pattu	819 54
Province of Uva.	
Makerakatti dam	712 43
Etimolawewa	45 0
General.	
Minor surveys	439 93
Total ...	24,038 66

Northern Province.

3. The survey of *Vavunikkulam* and its contours was completed, and Mr. Baker returned to Colombo when the wet weather set in to plot the work and make the necessary design and estimate. The lines for the contouring of the land below the tank were set out and partly finished, and are being completed by an Irrigation Surveyor. The tank proves to contain an area of 1,975 acres with 18 feet head of water at the sluice, and its contents are 596 million cubic feet, which it is estimated will probably suffice for the irrigation of 8,000 acres. The estimates have not yet been completed, but the scheme will probably cost Rs. 350,000.

4. The completion of the tracing of the channel from *Maha Galkadawala* to *Pavatkulam* has proved that a channel 26½ miles in length can be constructed between these two tanks, but there is heavy rock cutting near Pavatkulam, and the cost will be heavy, as there are 306,000 cubes of earth and rock to be excavated. In view of the postponing of the construction of Pavatkulam the estimate was not completed, but all the quantities have been taken out and are ready when the channel may be required.

5. *Akattimurippu Scheme.*—The completion of the Giant's tank and the beneficial effects of its immediate irrigation for some 13,000 acres of land on the right bank of the Aruvi-aru, while the inhabitants of the land on the opposite bank were unable to raise a crop at all last year, led to the urgent request by the Government Agent, Northern Province, and the Assistant Government Agent, Mannar, and the inhabitants of the similarly situated tank on the left bank of that stream, for the reconstruction of their tank also, and a sum of Rs. 1,800 was voted for the purpose of the survey of Akattimurippu. Mr. Bradley, who was to have taken charge of the restoration of Pavatkulam, being available, was sent there to carry out the necessary surveys. The tank is nearly as large as Giant's tank, but very shallow, and a large portion of its bed is cultivated, and when the rainfall is sufficient the cultivation gives most remunerative returns.

It appears that, though it is possible to cut a channel from the same tekkam or anicut that supplies Giant's tank, it was formerly not so served, but drew its supply from the same river some miles higher up, when another tekkam was constructed. It is desirable, if possible, to provide water to cultivate the land below the tank, and also the existing fields in the bed of the tank; in fact, to provide another tank, if such can be done at a moderate expense. With this view an examination is being made of a natural hollow in the ground about 3 miles from the Akattimurippu tank, which it is possible may prove of sufficient size to contain the required water, and which may be filled from the Kal-aru, a river to the south of it, for a less expenditure than the restoration of Akattimurippu will entail, and without involving the submerging of the valuable paddy fields in the bed of the tank.

North-Central Province.

6. In this Province the work of the topographical surveyors disclosed many interesting and important facts in connection with the irrigation of that Province, and the study of their plans disclosed the important connections that existed in ancient times between the various watersheds and the remarkable series of storage reservoirs that existed.

An examination of the ancient bund of Maha Kanadarawa, across the Kanadarawa-oya, near Mihintale, proved the existence of an exceedingly large tank there; its survey is now nearly complete, and its area will be equal to Kalawewa or Minneri. It has only one breach, and the bund appears in good order; it will water land through which the Northern Railway passes, and will possibly prove a very desirable scheme to take up. It is said that it received water from a tank called Eruwewa, which was fed by the Malwatu-oya above Nachchaduwa, and which also received a supply by a large channel taking water from the Mirisgoni-oya and the Dambulla-oya, which are the main feeders of Kalawewa at points a few miles north of Dambulla. This channel and Eruwewa tank I hope to have investigated this year. It passes through the populous and settled country between Dambulla and Anuradhapura, and is much more accessible than some of the schemes farther north. Close to Dambulla there is an ancient bund across the Mirisgoni-oya, which I had the pleasure of visiting a short time back with Mr. Alexander, the Assistant Government Agent of Matale, and from its appearance and reported length it seems probable that it formed a tank little inferior to Kalawewa in size, and was probably a supplementary source of supply to that reservoir. This also I hope to see surveyed or partly so this year. It is most important to obtain full information about the ancient schemes that are capable of restoration, and to know as far as possible their scope and object before spending large sums on construction, in order that the full advantage may be reaped of the immense quantity of earthwork which is left, to the value of millions of rupees, still available for the use of this and future generations. The provision made by the ancient irrigation engineers for passing the water from watershed to watershed and controlling and leading it where it was required show that it was as scarce and valuable then as it is now, and they probably made a great deal better use of it than their descendants do.

Eastern Province.

7. *Anicuts in connection with the Manalputty-aru Scheme.*—The surveys and levels necessary for the framing of the estimates for some four anicuts near Amparai which the cultivators have pressed for for some years, and for which they profess their willingness to pay, were completed by Mr. Nagamuttu, the Irrigation Inspector, and the plans and estimates are being prepared in the Head Office.

North-Western Province.

8. *Mi-oya Scheme.*—The surveys in connection with this scheme were at last completed, and the estimates are now being framed. This scheme was undertaken at the earnest request of the Government Agent, North-Western Province, the late Mr. F. C. Fisher. It is thought that about 5,000 acres may be benefited by it, all land adjacent to the Northern Railway. The cost will probably be about Rs. 200,000.

Southern Province.

9. *Kirinde-oya Scheme, Right Bank.*—The survey of this scheme was proceeded with. It is proposed to utilize the Ellagalla anicut for supplying water to both banks of the Kirinde-oya. The water supply is ample, provided storage capacity is available, and the soil is as good as it can be. The land is accessible and within easy reach of Hambantota, and the sea is only a few miles off.

10. *Walawe-ganga Scheme.*—The alternative surveys on the left bank of the Walawe-ganga were completed, and Mr. Kirthisinghe came to Colombo to plot the work. It is proposed to make a channel from above Liyangahatota anicut to Koggala tank, and an estimate of the probable cost of making a high level channel from that tank to Hambantota is also to be made. The length of channel required to Koggala will be 11 miles, and the top water area of that tank 1,053 acres, which, with a depth on the sluice sill of 17¾ feet, will give it a capacity of 507 million cubic feet. The available area of irrigable land below the tank is not less than 10,000 acres, and the scheme will provide for the complete irrigation of this area. The probable cost of the work, not including the channel to Hambantota, will be Rs. 500,000.

Province of Uva.

11. *Makerakatti Dam.*—On information I received from Mr. Halliley of the Survey Department I visited the gorge through which the Gal-oya escapes from the hills and flows down to the rich plains of the Eastern Province, where it is known as the Pattipolai-aru, which irrigates nearly 25,000

acres of land on its way to the sea. Further storage, however, is required, and for this purpose it is proposed to construct a supplementary reservoir adjoining Amparai tank called Kondavaddavan. It seemed possible, however, the same result or rather a greater result might be obtained by blocking up the Gal-oya at the gorge near Makerakatti, which is about 20 miles from Bibile, for a less expenditure; and the investigation of this scheme, therefore, was undertaken by Mr. Fraser, who was to have gone to Kondavaddavan. The work is nearly completed, and I expect Mr. Fraser in Colombo in a short time, when the result of his surveys will be plotted and a reliable opinion can be formed.

12. *Minor Surveys.*—The expenditure involved numerous small surveys that were required from time to time either to frame estimates for works or to supply information that was required in the course of the year.

WORKS OF CONSTRUCTION.

13. The expenditure under this head was as follows :—

	Rs. c.
Northern Province.	
Giant's tank	59,133 99
Kanukkeni tank	16,570 83
Karachchi scheme	18,478 86
North-Central Province.	
Kalawewa Yoda-ela	16,756 83
Maha Illuppallama	18,083 24
Minneri	69,247 59
Manankettiya	964 7
Nachchaduwa	60 0
Maha Galkadawala	94 92
Eastern Province.	
Kanthalai	5,580 62
Vakaneri	35,321 53
Rugam anicuts	22,739 42
Pattipolai-aru	3,678 91
Sakâmam Vammiyaddi scheme ...	11,950 97
Tempittiya	5,147 21
Unnichchai	11,480 11
Southern Province.	
Walawe-ganga	3,784 86
Kirinde-oya	37,983 62
North-Western Province.	
Deduru-oya works	14,189 60
Total ...	381,247 18

Northern Province.

14. *Giant's Tank.*—The restoration of this tank was completed on the 30th November. The expenditure during the year was Rs. 59,133·99. The bulk of the expenditure was on earthwork, of which 44,000 cubes were done. The tank had water in it the whole year, and several village tanks were supplied a second time to enable the villagers to have a sirapokam harvest for the first time in about twenty years. This scheme was started in 1895, and great difficulty and much sickness, both among the officers and coolies, was encountered. One officer lost his life, and another was obliged to give up his appointment on account of ill-health, but happily the work has been completed and the results have been both immediate and satisfactory. The unfortunate officer who succumbed to the climate was Mr. C. G. Blechinberg; and Mr. Chapman of the Public Works Department was obliged by ill-health to give up the appointment.

The bulk of the masonry was executed by Mr. L. M. Acland of the Public Works Department, and the credit of carrying the work to completion is due to Mr. N. M. Walker, who was transferred from the Public Works Department to the Irrigation Department, and by whom the greater portion of the earthwork and all the sluices were constructed. The labour employed has been almost exclusively imported, and the advances given have been successfully recovered.

The people, for whose benefit the works have been carried out, have in no way assisted in the work, and the Engineer in charge could not even get the jungle cleared by local labour. It is regrettable that a more worthy community has not benefited by the large expenditure of time, life, and money that has been incurred on this work.

The total cost of the work was Rs. 593,927, and about 13,000 acres of paddy were irrigated this year. There is probably another 6,000 or 7,000 acres of land available, and in ordinary years the tank will probably be able to irrigate this additional amount. At present the return on the capital invested should be about 1½ per cent., allowing for the cost of maintenance. The rate in perpetuity for the lands at present owned is fixed by the Ordinance No. 23 of 1889 at Re. 1 per acre, but there is no reason why all new land sold under the tank should not pay Rs. 2 per acre, when the interest may reach 3½ to 4 per cent., which is considered by the Central Irrigation Board to be a reasonable return.

15. *Kanukkeni.*—The tedious work of building the spill wall was pushed on and practically completed during the year. To do this before the rains commenced it was necessary to work at the pile driving both on week days and Sundays, as well as to employ relief parties during the dinner hour. Had this not been done, another year must have elapsed before the breach in the bund could have been filled in and the work completed. The presence of a detachment of pioneers saved the situation; local labour gave no assistance, and would not work at the winch handles of the pile drivers. The earthwork has been done by Karativu men from the Jaffna peninsula. The expenditure during the year was Rs. 16,570·83. The breach is now being filled in, and the work will, I expect, be out of hand and completed by June.

16. *Karachchi Scheme.*—This work was commenced in July, but owing to the works on the Northern Railway providing remunerative employment to local labour, none was obtainable for the first two months. In September, however, a start was made with 150 Jaffnese and some 40 Indian coolies from Giant's tank, and in November the remaining force from Giant's tank were transferred there, amounting in all to about 400 coolies.

The first work taken in hand after building the necessary lines was the earthwork on the bund of the Dri-aru tank, a subsidiary tank on the main channel of about 212 acres having a head of 14 feet. This work made good progress, and it is hoped it will be so far advanced as to catch and store any water that may run off in April and May, if we are fortunate enough to have a few days' rain, and thus provide for the dry season, June, July, August, and September, when the want of water may form a very serious obstacle to the progress of the works. About two-thirds of the bund of the Dri-aru tank is now completed, and 300 coolies are working on it. The works are in charge of Messrs. W. Brown and N. M. Walker, the latter having been transferred with the labour from Giant's tank on its completion.

North-Central Province.

17. *Improvements to Kalawewa Yoda-ela.*—The working season on this work was much curtailed, as the Yoda-ela was required for irrigation in June. Masons were scarce, and labour was in a very unsettled state owing to the proximity of the Northern Railway works. In the previous year the 29 miles of the ela from Anuradhapura southwards, *i.e.*, from the 25th to the 54th miles, were in hand. Last year the work was confined to that portion lying between the 11th and 25th miles, and about 20,000 cubes of earthwork, 150 cubes of cement concrete, and 65 cubes of rubble masonry were actually completed. A circuit bungalow and a guardian's bungalow on the road from Talawa to Kekirawa near the 16th mile on the Yoda-ela were completed. Had more masons been available, better progress would have been possible. The expenditure during the year was Rs. 46,756·83.

18. *Maha Iluppallama.*—The south sluice was finished, but further works were necessary to make the spill wall secure, as it was found that the rock on which it was founded permitted water to percolate through it, and a curtain wall is required both in front and behind to make the work safe. That in front was put in. The earthwork, with the exception of the main breach, was well advanced to completion; the main breach is now being filled in, and it is expected that this work will be completed before the next wet season. The place is one of the most unhealthy that I know, and bears the worst repute among coolies; consequently labour is exceptionally difficult to obtain, and I shall be exceedingly relieved when the work is completed. It is a legacy from the Provincial Irrigation Board, and a very costly one too. 4,400 cubes of earthwork, 99 cubes of masonry, 46 cubes of concrete, 50 cubes of rock cutting, and 287 cubes of puddle were done during the year, and the expenditure was Rs. 18,083·24.

19. *Minneri Tank.*—The work on this fine tank made very satisfactory progress. The low level sluice valve tower was raised above spill level, and the northern high level sluice was taken in hand. When this sluice and bisokotuwa were exposed, and the earth covering it excavated, it was found to be probably unique, in that it disclosed what has long been a doubtful point, the manner in which these valve towers or bisokotuwas were worked: the founds and the walls bore distinct records in socket holes and slots for heavy timbering, and there is no doubt that heavy timber frames were formed inside the pits, into which planks or doors were slid, which closed the openings or opened them as required, while the timbering itself formed a support to the plank-like slabs of stone with which the pit was lined. There is no doubt that the decay of this timber has caused the failure which has overtaken these bisokotuwas one and all. This bisokotuwa has been rebuilt, and the stones lining it reset in cement with concrete backing, so that it will stand as a record of the method used in ancient times to regulate the flow of water through the culverts. The new sluice is fixed where the entrance to the inlet culvert formerly stood.

Minneri tank has, so far as is known, never been breached. I know of no record relating to its construction, but it is recorded in the *Mahawansa* that Aggabodhi I. constructed a great channel into it. This was in the sixth century, so that it had evidently been developed to its full capacity by that time, and the great channel of Aggabodhi I. may yet have to be restored, when 10,000 or 15,000 acres of cultivation below it take up the water stored under its 5,000 acres of surface.

In the high level sluice 668 cubes of earthwork and puddle, 48 cubes of masonry in cement, 65 cubes of concrete, and 17 of dry masonry were built between June and the end of the year.

The earthwork in the two spill waters was complete, and only the deviation of the road remains to be done. In the main channel the incomplete portions of the first 4 miles were finished off, and the remaining 5 were roughly cut. They are now being trimmed and cut to the correct level. The water was allowed to run down the first 4 miles, when the tank began to fill at the end of the year. In the channel 15,308 cubes of earthwork, 655 cubes of rock blasting, 337 cubes of puddling, 80 cubes of masonry in cement, 65 of masonry in lime mortar, 78 of dry masonry, and 77 of cement concrete were completed.

The total work done on the tank and channel amounted to 24,482 cubes of earthwork, 655 cubes of rock cutting, 143 cubes of cement concrete, 195 cubes of masonry in cement and lime mortar, 140 cubes dry masonry, 337 cubes of puddling, 40 cubes of road metal, and 66 acres of clearing jungle.

One iron girder road bridge was erected over the channel, and the guardian's bungalow was also built. The Indian coolies that were brought from Kuddappah left as soon as they had worked off their advances, but their places were taken partly by Tamil labour and partly by Moors from the Eastern Province, and the Irrigation Engineer, Mr. Gordon, deserves much credit for keeping together a force of nearly 300 men throughout the year. The total expenditure was Rs. 69,247·59.

20. *Manankettiya.*—The small expenditure of Rs. 964·07 represents the money spent on the erection of lines and purchase of materials and charge to Transport Fund.

21. On Nachchaduwa and Maha Galkadawala no work was done.

Eastern Province.

22. *Kanthalai.*—At this tank the extension of the main channel was proceeded with. The work is earth cutting almost exclusively with masonry outlets, and was delayed by the difficulty in obtaining possession of certain private land through which the channel runs. 1,440 cubes of earthwork were excavated, and the expenditure was Rs. 5,580·62.

23. *Vakaneri.*—The local labour supply at this work was even more unsatisfactory this year than last, and dependence has to be placed almost entirely on imported labour. Another gang of 283 coolies were imported in June, and it is found necessary to make annual importations to keep up the force, and it is hoped that as the work gets better known a connection may be established that will ensure a regular supply. The local labour cannot be depended upon, because there is so much cultivation now going on in the Eastern Province that the inhabitants are fully employed in reaping and sowing in various parts of the Province; when they work, however, they work well.

The work was chiefly confined to the construction of the main bund. Considerable difficulty was experienced in carrying the puddle trench down to the clay, and in some places 16 feet of running sand gave much trouble before it could be cleared out and filled in with puddle.

13,000 cubes of earthwork were done and 1,800 cubes of puddle. The total earthwork now done amounts to one-third of the whole, but it is at the bottom end where all the difficulties occur. Only 500 feet more of the trench remain to be completed, and more rapid progress is hoped for this year. The spill channel was also excavated and completed, and 3,300 cubes of earthwork taken out.

On the northern channel 426 cubes of hard rock were blasted, 8 cubes of cement contrete and 15 cubes of masonry were built. The gravel service road to the anicut was completed and seven stone culverts put in.

There were six deaths among the coolies, and the health generally has been much worse than in former years. Mr. Roberts, Irrigation Surveyor, was obliged to resign from ill-health. The apothecary had to be removed to Habarana, and his successor has also suffered.

The Irrigation Engineer, after three years of immunity, was laid up with several severe attacks of malarial fever and obliged to go to Kalkudah and Batticaloa for change.

24. *Anicuts under Rugam.*—The working season in which the foundations of the anicuts can be laid extends only from May to October. It was found that the water level of the river was much higher than had been estimated and more baling was required. In the early part of the year materials were prepared, stone was wedged, and bricks were made.

At Kumukaddu anicut the whole of the concrete foundation was laid, one abutment was built, and a portion of the other.

At Sankulakulam the pitching and part of the foundations were laid.

At Verakadu the cylinder foundation was also proceeded with, and forty cylinders were built and partly sunk; some have reached their full depth.

The Kadavadipalam anicut was not worked at owing to scarcity of labour. Much delay was caused by the scarcity of carts for the transport of material. The greater portion of the material required for next season's work has been collected.

The total expenditure on the above work was Rs. 22,739·42.

25. *Pattipolai-aru Scheme.*—On the preservation of the anicuts on the Pattipolai-aru scheme Rs. 3,678·91 was spent. 188 cubes of stone were wedged, 117 cubes of stone were transported, 117 cubes of stone were laid on the slopes. The size of the stones and the character of the work was very good, the difficulties of transport across sandy rivers and streams were considerable, but it was successfully and economically done.

A guardian's bungalow was completed at Irrakamam at a cost of Rs. 1,802.

26. *Sakamam-Vammiyaddi Scheme.*—The bulk of the earthwork on Sakaman tank having been previously completed, all available labour was put on to the Vammiyaddi tank. The service road was cleared. The jungle was cleared off the bund. The masonry in the southern spill was completed, and the northern spill also practically finished. The sluice was built and finished, except the coping and some dry masonry on the slopes.

The earthwork in the bund was completed with great difficulty just before the monsoon burst, owing to water being exceedingly scarce, and much delay in puddling the trench was necessarily incurred. The bund and sluice were finished in October, before the rains began; but on the 30th November a leak occurred at the sluice, and in a short time the bund was breached and the sluice destroyed. The full amount of the damage has not yet been ascertained, as the water has not yet subsided, and it has not been possible to take any sections. The failure is due to the want of proper material with which to construct the bund; only sand is available on the spot, and very little puddle can be obtained in the district.

Labour, again in this case, is the great trouble, and the Irrigation Engineer and Irrigation Inspector were compelled to advance over Rs. 400 on their own responsibility to obtain labour to fill in the breach. Vammiyaddi is an unhealthy place, and coolies work there unwillingly. 5,481 cubes of earthwork and 53 cubes masonry in cement and dry masonry were performed, and the expenditure was Rs. 11,950·57.

27. *Tempittiya.*—The earthwork made slow progress; labour is very scarce here. In all 3,464 cubes of earth have been cut and put in the bank, and 390 cubes of puddle, 2,156 cubes of earth, and 218 of puddle were done during the year. These quantities exceed the quantities in the estimate by 404 cubes and 51 respectively, and the main breach still remains to be closed when the masonry is completed. The reason for this excess is that it was necessary to remove from below the breaches in some cases a depth of 6 and 8 feet of sand and boulders before putting on the bank; this was not allowed for in the estimate. No masons would work at this tank, and, here again, had not the small force of pioneers at the Rugam anicuts been available during the wet season, when masonry work is not possible there, the work would have dragged on for years. A portion of one of the ancient culverts has been utilized, but the other, having completely fallen in, had to be removed. The spill wall is nearly completed. The expenditure for the year has been Rs. 5,147·21.

28. *Unnichchai.*—I cannot report satisfactory progress on this work, although, from its proximity to the populous district of Eraur on one side and Batticaloa on the other, it was anticipated that a large labour force would be available. This anticipation has not been realized. In December last year I called for tenders in the Indian papers, thinking that it might be possible to obtain a contractor from there. One gentleman came over and visited the site and made a tender, but his figures were so much in excess of the estimate that its acceptance was out of the question. No other satisfactory tender was received. It will be necessary to obtain labour from India for this work also. The approach road has been practically completed; seventeen stone culverts and an iron bridge built. The inspection bungalow was completed. The site for the bund was cleared of jungle and forest throughout its length. A commencement was made in the excavation of the foundations of the spill wall. The clearing of the jungle on the lines of the two channels has been commenced. The total expenditure was Rs. 11,480·11.

Southern Province.

29. *Walawe-ganga Improvements.*—The bulk of this work had been previously completed. During the year bridges were built over the main channel at Mahadeniya and Beminiyanwila drainage channel, and pillars for a footbridge at Rambawihara. Safety spills have been constructed at Barowakumbuktota, Pallarota, and Mamadola. The right abutment and wing walls of the anicut have been raised, and the flood bank adjoining it in part completed. The expenditure was Rs. 3,784·86.

30. *Kirinde-oya Scheme.*—The raising of Tissawewa bund was completed, and the requisite alterations to the sluices and spills. The western high level channel has been extended 3,400 feet. The new channel from Debarawewa has been cut as far as the 1st mile.

The bund of Yodiyawewa has been raised, and the bund along the edge of the fields has also been completed. The new spills at Yodiyawewa have been commenced, and also the bridge to carry the road over the spills. Work was commenced on the new low level channel from Yodiyawewa.

At the Ellagalla anicut the masonry work has proceeded, but was much interrupted by sickness. It is stated that the men cannot work there more than a month at a time, and constant changes are necessary. This was also the experience when the anicut was being constructed. Mr. Bowden, Assistant Engineer, I was obliged to remove owing to frequent attacks of malarial fever.

Of cooly labour the local supply was satisfactory, and it is almost the only place in the Island, so far as my present experience goes, where this is the case. The expenditure was Rs. 37,983·62, expended on 20,352 cubes of earthwork, 26 cubes of masonry and concrete, and the balance chiefly on work connected with the alteration of the masonry sluices and gates on the tank and supply channel.

North-Western Province.

31. *Deduru-oya.*—The completion of the main channel was proceeded with. The work which delays the opening of the main channel to the end is the boring of a tunnel in the solid rock: it is not a work which would have taken long had machine drills and compressed air been available, but there being but a small quantity, hand labour and local miners have had to be employed, and the rock cutting to the approach to the tunnel and the tunnel itself have proceeded slowly. Rs. 1,730 was expended on this work, which, it is hoped, will be completed this year; Rs. 2,000 were spent in putting permanent iron footbridges across the spills; Rs. 1,850 on the completion of the Inspector's bungalow; nearly Rs. 800 on the improvement and upkeep of the road alongside of the channel; Rs. 300 on a masonry retaining wall in the channel; and the balance on sundry smaller items in connection with the work. The total expenditure for the year was Rs. 14,189·60.

This completes the account of the Rs. 381,247 spent on the principal works of construction.

32. *Minor Irrigation Works.*—The minor irrigation works which have been restored or repaired during the year under the Director of Irrigation are:—

In the Western Province Boralesgomuwa tank sluices were repaired by Mr. Henman, the Irrigation Engineer employed on the restoration and repair of minor works. The northern sluice was entirely reconstructed, and most of the southern sluice was rebuilt. A puddle trench was cut and filled round the wing walls, and all leaks through the masonry properly stopped. The cost was Rs. 802·82.

33. The most important of the minor works was the restoration of the Alut-ela at Badulla in Uva. This was damaged and rendered useless by a heavy storm which fell in 1896, just after the Yelverton estate had been cleared, and consequently an unusual amount of silt was washed down the newly-cleared hillside, and the channel blocked and breached in many places. An estimate of Rs. 7,070 had been previously submitted for its repair by the Provincial Irrigation Board, but it was not sanctioned. In March the Irrigation Engineer took the necessary measurements and sections for framing the estimate for its repair, and in the end of April an estimate of Rs. 3,792 was sanctioned. The work was begun in May, and a further estimate of Rs. 1,500 has since been sanctioned for its completion, making Rs. 5,292 in all.

The Irrigation Engineer reports as follows:—

> The jungle has been cleared and uprooted, the channel properly cleared of silt, boulders, &c., and excavated to a true and certain gradient.
>
> Immediately above the channel, and for nearly a mile of its length, is the Yelverton tea estate rising up precipitately 800 feet or so, and the opening up of this estate has been the cause of the ela being breached. After heavy rain big volumes of storm water come down at various points, and it was necessary to provide means of passing these storm torrents over or under the channel. With this end in view two galvanized iron troughs have been erected, of a span of 19 feet and 13 feet respectively, and the hill torrents have been passed below the channel.
>
> At a third place a cement concrete culvert 15 feet long has been constructed, and the storm water carried across and through the bund by an aqueduct. Gullies on the estate have been cleared and made to collect the storm water at these various points, and I believe that very little will now find its way into the channel.
>
> After the channel had been cleared of jungle, &c., it was found that there were ten or twelve storm water culverts constructed to pass hill water below the channel. These culverts were quite choked up with boulders, and badly in need of repairs.
>
> Piers, abutments, sills, and beaching had to be reconstructed in several of them, and one big culvert collapsed entirely while the coolies were clearing it. This had to be rebuilt.
>
> At various points where the channel had been cleared of jungle, silt, &c., big slips occurred after heavy rain, and it was found necessary to construct retaining walls in dry masonry at these points.
>
> Near the headworks the big flood of December, 1896, had washed the ela out of existence for a distance of 50 yards or so, and a deviation in deep cutting has had to be made; also in the 4th mile a deviation 100 yards long was found necessary.
>
> There is no reservation along the channel below the tea estate, and large quantities of silt, boulders, &c., have had to be removed since the channel was excavated to its proper level, owing to the abnormally heavy rains of the past four months.
>
> No provision was made in the original estimate for the necessary repairs to and reconstruction of culverts, retaining walls, deviation in 4th mile, or stone water gullies above the channel, and in consequence the estimate was considerably exceeded.
>
> A supplementary estimate of Rs. 1,500 has been put forward and sanctioned, and the channel will be completely restored and made sound early in 1903.

The work has since been completed and is now in use.

34. *New Temporary Offices.*—These offices were commenced in May and completed in November, and occupied on the 7th of that month. The total cost is Rs 7,299·20, or 8·4 cents per cubic foot.

35. In addition to the supervision of the above works, the Irrigation Engineer in charge of minor works made a thorough examination and report on the principal works in Sabaragamuwa at the request of the Government Agent. Ugalkaltota, Rakwana-ganga scheme, the Kolonna korale irrigation works, and the Batugedara works were all reported on and estimates for the repair framed.

Ugalkaltota is nearly completed by the Irrigation Sub-Inspector working under the Irrigation Engineer, and the others will be taken up in due course.

36. In August the Government Agent, Central Province, was informed that the Irrigation Engineer was able to instruct the Irrigation Sub-Inspector to take up the repair of the Rothschild estate ela as soon as he was informed that the latter's services were available, but various suggestions and correspondence put off the commencement of the scheme till the present time. It is only now being commenced.

MAINTENANCE.

37. The expenditure on the maintenance of the various works in the several Provinces amounted to Rs. 76,806·10.

38. In the *Northern Province* the maintenance of the Giant's tank works, of Kanukkeni, and of Periyakulam were carried out under the Director of Irrigation at a cost of Rs. 4,089·81.

The Government Agent, by the Chief Irrigation Inspector and his Assistants, maintained the following tanks :—Vavuniya, Maha Irambaikulam, Mandukottai, Mamadu, Kanakarayankulam, Iratperiyakulam, Periya Olukkulam, Vengalacheddikulam, and the sluiced tanks in the Vavuniya District. On these was spent the sum of Rs. 2,362·40.

Some trouble was experienced with Mandukottai tank, in which the bund sunk no less than four times during the year, probably caused by leaks in the sluice stop wall, but it will be opened and examined this year, and I hope successfully repaired.

At Iratperiyakulam a similar subsidence took place twice, and this also will be opened and repaired this year.

The spill at Periya Olukkulam was slightly damaged, but can be repaired on the upkeep vote.

A portion of the Maha Irambaikulam bund will also require opening, and some large roots cut out and puddled this year also.

The quarters for the Irrigation Sub-Inspector were nearly completed.

39. In the *North-Central Province* all the Crown tanks and elas were efficiently maintained, and a sum of Rs. 16,046·82 was spent on such maintenance.

The works include Kalawewa, the Yoda-ela, Nuwarawewa, the city tanks at Anuradhapura, Maha Madawachchiya, Minneri, and the Talawe-ela.

40. In the *Eastern Province* all the important Crown tanks were maintained in good order, and few, if any, complaints were received during the year. The expenditure amounted to Rs. 14,263·46.

The Government Agent has, however, in his charge several small tanks that have been restored by Government, and on these a sum of Rs. 147 was expended.

41. In the *North-Western Province* the principal works in the Kurunegala District, including the Deduru-oya channels and Batalagoda tank, were maintained, and on these a sum of Rs. 7,674·72 was expended.

The works in the Chilaw and Puttalam Districts and distant from Kurunegala are in charge of the Government Agent through his Chief Irrigation Inspector and his Sub-Inspectors. On these a sum of Rs. 3,109·56 was spent during the year.

42. In the *Southern Province* the Crown tanks and works in the Matara District were maintained in good order, and the channels connected were much improved. In the Tangalla and Hambantota Districts the maintenance was efficiently carried out.

The Government Agent, with a Sub-Inspector, has charge of several small village tanks in the Galle and Matara Districts. On them no expenditure was incurred during the year.

A sum of Rs. 17,796·14 was spent in this Province under the Director of Irrigation.

43. In the *Western Province* the Government Agent has charge through his headmen of the several small village works that exist, on which a sum of Rs. 312·59 was spent.

44. In the *Central Province* the Government Agent has charge of all irrigation works. There are none of great importance, and he has under him three Irrigation Sub-Inspectors, one for the Kandy District, one for Nuwara Eliya, and one for Matale. He has also the assistance of the officers of the Public Works Department, when required, for making payments. His expenditure last year was Rs. 1,896·80.

45. In the *Province of Uva* the Government Agent has retained charge of all the irrigation works, and has two Irrigation Sub-Inspectors to do the work. His expenditure last year was Rs. 2,476·09.

46. In *Sabaragamuwa* the Government Agent, with one Irrigation Sub-Inspector, takes charge of the maintenance of the irrigation works, and this Inspector also carries out the works of repair under instructions of the Irrigation Engineer from Colombo when required. His expenditure was Rs. 3,384·46.

47. In Appendix B is shown the Crown works in each Province of which the maintenance is under the Director of Irrigation, and also those in charge of the Government Agents; and a table giving the expenditure on maintenance on each work in each Province is attached thereto.

48. *Control of the Cultivation of larger Tracts.*—The appointment of special officers to be called Irrigation Superintendents has been sanctioned by Government to control the cultivation of the land under the larger irrigation schemes, and officers have been appointed for the Pattipolai-aru, the Giant's tank, the Kalawewa Yoda-ela, the Deduru-oya, and the Walawe-ganga scheme.

49. In all these schemes, except the Pattipolai-aru, the water is used wastefully and unnecessarily, rules and regulations are set at nought, and the channels and works are cut and damaged and water is stolen; the consequence is that the supply, which is really ample in every case for a great deal more land than is actually irrigated, is said to be insufficient. The same waste is noticeable in almost all the works that have been made by Government in every part of the Island. In one case in the Central Province I found water sufficient for 1,500 acres reported insufficient for 90, and although the channel had been extended to benefit other land beyond, the additional land could not be cultivated because the 90 acres used up water sufficient for 1,500.

50. In another case in the Southern Province the water flowing down the channel was enough for 10,000 acres, but was said to be insufficient for 3,000.

51. In the North-Central Province, Kalawewa, which ought to suffice of itself for the irrigation of at least 20,000 acres, is said to be insufficient to supplement and complete the irrigation of under 5,000 acres, the bulk of which is irrigated by village tanks, which are filled through Kalawewa before Kalawewa itself is full.

52. It is therefore evident that much attention is needed in the future to remedy the abuses that exist, and I am sure that much difficulty will be experienced in enforcing economy in the use of the water used for irrigation. I hope, however, that the appointment of the new Superintendents of Irrigation will be attended with encouraging results, and that the more important schemes at any rate will be gradually brought to a reasonable state of economy and order.

53. In India, where the rate charged for the irrigation of 1 acre of paddy for one crop is Rs. 6 and over, as compared with the usual Ceylon rate of about Re. 1 per acre for as many crops per annum as the soil will bear and the cultivators choose to sow, the distribution of water is most strictly supervised by the Irrigation Engineers, and in the most recent paper on Recent Irrigation in the Punjaub by Mr. Sidney Preston, C.I.E., A.M.I.C.E., speaking of the Chenab River System, says :—

> Some years ago the system followed was to distribute the supply between all the branches, running each steadily with its due share of the available supply. * * * This has now been altered; the necessary reduction is made *in time* instead of in volume. Thus, every distributary when open at all is run full, so that all the outlets on it work fairly as designed, and the tail villages obtain as good a supply as those at the head; when any given distributary has received its allotted time of full supply, it is entirely closed and the water passes into others ..... This system has also the enormous advantage of economizing water, as the shortest length of channel is kept wet, and consequently the loss by absorption and evaporation is reduced to a minimum .....
>
> Coming now to the cultivators ..... the distribution of the supply in the water-course between the cultivators dependent on it is done in accordance with a share list, which gives each man the right to use the whole supply for a certain period, during which time he may irrigate as much land as he can. If he has been unable to water the whole of the area he has under cultivation in the time at his disposal, the area unwatered must wait until his turn comes round again in fifteen, twenty-one, or possibly thirty days' time. The period for which each man has the use of the water is usually a multiple of four hours, so that a man may get water for four, eight, or twelve hours. The cultivators know exactly when each man's turn is up, and in times of tight supply and keen demand the next shareholder will be waiting ready with his spade to take over the water-course and turn the water on his own land directly the turn of his predecessor is up. Needless to say, disputes are not infrequent and have to be adjudicated on by the canal officers.

The following table shows the rates for the various classes of crops grown :—

Class.	Crop.	Rates per acre. Rs. As. Pie.
1 ...	Sugarcane	7 8 0
2 ...	Rice	6 4 0
3	Orchards, gardens, tobacco, indigo, vegetables, poppy, melons, coriander, cannine, and aniseed	5 0 0
4 ...	Cotton, fibres, dyes (except indigo), oil, seeds, Indian corn, and all cold weather crops, except grain and lentils	3 12 0
5 ...	All hot weather crops other than those mentioned above ...	2 8 0
6 ...	Single watering to plough not followed by a crop ...	1 4 0

Besides these direct water-rates, there are three other small rates amounting to one rupee four annas, which are levied on the area irrigated, irrespective of the crop grown, and the receipts from which are credited to the various accounts of the General Administration.

54. Comparing the above rates with those exacted here, and bearing in mind that the rates in the schedule refer to every crop and are not per annum, the lot of the poor Ceylon villager, as compared with the poor Indian villager, does not present an unfavourable contrast.

LEGISLATION.

55. One case under the new Ordinance for cutting the main channel on the Walawe-ganga works and taking water in an unauthorized manner resulted in a fine of Rs. 150 being inflicted, which was confirmed by the Supreme Court in appeal.

LABOUR.

56. During the year 508 coolies were obtained from India at a cost to Government of Rs. 8·36 per head. All the advances of the 1,100 odd coolies who were working at Giant's tank were paid off before the completion of the works; at no time did these advances exceed Rs. 2,000.

The local labour supply was in most cases unsatisfactory and intermittent, and had it not been for the few pioneers available (and it is unfortunate that they are so few), neither Kanukkeni, Minneri, or Rugam, or the Deduru-oya works would have made the progress they did.

STAFF.

57. The following changes took place during the year :—

Mr. Parker, the Irrigation Assistant, proceeded on leave on the 24th June, and Mr. J. H. W. Park was appointed to act for him.

Mr. Brown proceeded to Karachchi to take charge of the works there in the month of July, and Mr. Norman Walker, having completed the Giant's tank scheme, joined him with such of the Giant's tank labour as were willing to go there in October.

Mr. Bradley, having completed the plan and estimate of Pavatkulam, which however it was not considered desirable to undertake at the present time, with Mr. Watts, completed the trace of the channel from Maha Galkadawala to Pavatkulam, and from there proceeded to the survey of the

Akattimurippu scheme on the left bank of the Aruvi-aru, where he is still engaged. Mr. Watts proceeded to England in October, his services having been dispensed with.

Mr. Hilton, whose health broke down, also returned to England in October.

Mr. Doxat, having completed the plans of Nachchaduwa tank in the Head Office, was employed in completing the contour plan of Maha Kanadarawa tank near Mihintale, after which he will take up the construction of Nachchaduwa.

Mr. Emerson, having completed the survey of the Mi-oya scheme, returned to Colombo to prepare the plans, while still retaining charge of the Deduru-oya works.

Mr. Chute, who had previously been engaged on the survey of the channel from Maha Galkadawala to Pavatkulam, was transferred in February to Rugam, and took charge of the construction of the anicuts there.

Mr. Fraser, having completed the plans for Pattipolai-aru, proceeded to Uva to make the survey of Makerakatti dam.

Mr. De Kretser returned to the Public Works Department in May.

I much regret having to place on record the death in December of Irrigation Sub-Inspector Chelladurai of pneumonia at Dambulla. He was a very promising officer, and, though only appointed in July, had already earned the approval of the Government Agent under whom he was serving.

FUTURE SCHEMES.

58. The information obtained during the time occupied in investigating the schemes already under consideration and the progress of the topographical survey disclosed the existence of a chain of most important tanks and channels between Dambulla and Mihintale, by which in ancient times the water of the Mirisgoni-oya was first stored in a large tank near Dambulla called Kandalama, which would form an admirable supplementary reservoir to Kalawewa. Besides irrigating a large tract of land in the North Matale District of the Central Province, the water from this tank could either be allowed to flow direct to Kalawewa down the river or be diverted, with what further river water was required, by means of a large channel into the Malwatu-oya valley, filling a large tank called Eruwewa on the way, and thence to Nachchaduwa. From Eruwewa an overflow channel is said to exist into the valley of the Kanadara-oya, supplementing the supply of Maha Kanadarawa near Mihintale and Maha Galkadawala near Madawachchiya. These schemes it is most important should be thoroughly understood and investigated before further works of construction on the system are undertaken, and they are now being surveyed. They are all nearer Kandyan civilization and in a more thickly populated country than most of those already investigated; and their outlet will be the Northern Railway. Whether they were formerly connected with the Elahera canal from the Amban-ganga is as yet undetermined and remains to be investigated. These schemes are the most pressing, but there are many others in the south and east that merit investigation.

FUTURE POSSIBILITIES.

59. The soil under these tanks is in, I may say, every case most productive, given water for irrigation, and there is nothing to hinder many other crops besides paddy being cultivated with profit.

Cotton in Egypt on good soil yields a return of £11 per acre. I do not know whether the climate of the low-country here is dry enough for the successful introduction of Egyption cotton, but other kinds will certainly grow. Hemp in Manila from the plantain stem (*Musa textilis*) commands £50 per ton in the London and American markets.

Cocoanuts could be grown with irrigation in the driest parts, and fruit that will bear transport, such as the mangosteen and the durian, would prove profitable.

Cacao would probably also succeed when sheltered from the wind.

Only money and enterprise are required to prove the fertility of the soil and take advantage of the irrigation now being provided.

RESULT OF PAST IRRIGATION.

60. The country most altered by irrigation is that around Anuradhapura. When I first went there in 1880 the inhabitants were existing only, and barely that: they were poor in goods, poor in physique, and eaten up by parangi. They had many of them paddy fields, but the tanks were not restored, and the crops they succeeded in raising were often scanty for want of water and infrequent, and they depended as much on their chena crops as on their paddy crops for their food.

Now the inhabitants are well-to-do, well-nourished, and parangi has comparatively ceased. On my last visit to the Yoda-ela I heard from more than one source that in most of the villages a supply of grain was stored for future use sufficient for from two to four years to come. The disposition of these villagers, however, is conservative and jealous, and they have the greatest antipathy to any strangers, even of their own race, settling amongst them, and at once combine to drive him out. The position they take up is indefensible, and the railway will, I hope, speedily bring them to their proper level. I attribute the small increase in actual numbers, as disclosed by the last Census, in the past decade to this jealous conservatism; they require fresh blood among them and new ideas, and every encouragement should be given to strangers to settle everywhere in the villages. They are also so well off that they do not care to work for wages, and if they work they are bad workers. They have repaired their tanks, it is true, not of themselves or of their own will, but in spite of themselves, and because they have been compelled to do so, and they deserve no credit for what they have done; the credit is due to the officers who have made them work.

The country under Giant's tank is the most recent example of the benefits conferred and not appreciated, and the rupee per acre rate is paid with reluctance, and the benefit accepted with ingratitude.

RAINFALL.

61. The rainfall during the year was everywhere in excess of the average, and the works of surveys and construction were in some instances delayed in consequence. No serious floods, however, damaged any of the larger works, and the village tanks, as a rule, escaped better than could have been hoped.

VILLAGE TANKS, CHANNELS, AND MINOR WORKS.

The following extracts from the Government Agents' reports of the various Provinces will give some idea of the progress made :—

Northern Province.

62. A statement of work done in each district :—

Particulars.	Jaffna.	Mannar.	Mullaittivu.
	Cubes.	Cubes.	Cubes.
Annual earthwork	638	6,516⅞	6,392½
Extra labour in repairs to breach	—	180	277
Total Earthwork done ...	638	6,696⅞	6,669½
	Days.	Days.	Days.
Earthwork	1,276	13,393¾	13,339
Bund and spill clearing	296	525	6,015
Turfing	194	190	1,617
Total Days done ...	1,766	14,108¾	20,971

Earthwork on account annual and extraordinary works ...	638	6,696⅞	6,669½
Earthwork on account of fine money	603½	—	2,570½
Total Earthwork done ...	1,241½	6,696⅞	9,240

Work was called out in 507 tanks, as against 501 in 1901, as follows :—

	No. of Working Tanks. 1901.	1902.
Jaffna	32	32
Mannar	179	178
Mullaittivu	290	297
Total ...	501	507

Breaches.—I am glad to be able to report that no serious breaches occurred during the heavy rains we had last year. The working tanks that breached, ten in number, were filled in by the villagers at once, as the breaches were small ones. This is satisfactory, as it shows that the villagers are beginning, after plenty of nagging, to realize the importance of keeping their wan* open.

Cement Pipe Sluices.—Sixteen cement pipe sluices were fixed during the year 1902, two in the Mullaittivu District and fourteen in the Mannar District.

The following pipes were made in the Vavuniya factory :—

	6-in. Set.	9-in. Set.
Horizontal pipes	760	96
Vertical pipes	380	30
Angle pipes	6	—

A supplementary estimate has been submitted for completing the work. The junction blocks and a few more pipes are all that is required.

Southern Province.

63. On the collection of irrigation rates due from lands under Waggalmodara and Dedduwa, the Government Agent says : The following statement indicates the progress made during the year under review :—

Name of Work.	Amount recovered up to December 31, 1900. Rs. c.	Amount recovered up to December 31, 1901. Rs. c.	Amount recovered up to December 31, 1902. Rs. c.
Waggalmodara ...	1,561 31	1,713 20	2,426 37
Dedduwa ...	5,072 60	7,185 36	12,927 3

* * * *

Mr. Van Houten was appointed Sub-Inspector of Irrigation for the Galle and Matara Districts. His work lies chiefly in the Matara District, where there are 126 village works.

In the Hambantota District the village works are in the charge of Mr. Ferguson, Chief Inspector. The number of village tanks is 632, of which 457 are situated in the West Giruwa pattu, 127 in the East Giruwa pattu, and 48 in the Magam pattu. The work done on them consisted of 9,557 cubes of earthwork and 27,713 square yards (about 5¾ acres) of bund clearing. Sluices should be provided for some of the larger tanks.

Eastern Province.

64. The Government Agent reports as follows :—

Village Tanks.—Of these there are 150 in the Batticaloa District, only one of which exceeds 6 feet head of water ; they irrigate some 7,000 acres of land only, as compared with the 47,677 acres irrigated under the large restored irrigation works, with which they are entirely unconnected, depending as they do for their supply of water solely on "munmari" or "vanam" rainfall, and are maintained in order by the villagers themselves under communal rules under Ordinance No. 23 of 1889 ; they are supplied with cement pipe sluices at cost price whenever applied for by them.

* "Wan" means "spills."

During the year, at the instance of the Director of Irrigation, the village tank staff was reduced* to one Sub-Inspector for the Batticaloa District and one for the Trincomalee District, the services of the Chief Inspector and one Sub-Inspector being transferred to the North-Central Province for more important work in the Department.

The usual returns are appended:—

Statement of Cement Pipes manufactured and issued during 1902.

* Two men being ample to look after 142 tanks.—H.W.

Western Province.

65. The report of the Government Agent is as follows :—

The following amounts were apportioned for the maintenance of irrigation works during the year 1902 :—

	Rs.	c.
Polgaha tank		
Kadurugaha tank	200	0
Dikmaga Ihala tank		
Dikmaga Pahala tank		
Attidiya sluice	33	0
Nikatu-ela sluice	136	0
Total ...	369	0

2. The amounts expended were as follows :—

	Rs.	c.
Polgaha tank	50	0
Kadurugaha tank	60	0
Dikmaga Ihala tank	50	0
Dikmaga Pahala tank	40	0
Attidiya sluice	7	25
Nikatu-ela sluice	104	50
Total ...	311	75

3. The Kesbewa tank was cleared of its weeds, and the branches of the trees round the tank were cut down in April, 1902. The cost of the work (Rs. 99) was paid out of the irrigation fines.

Central Province.

66. The remarks of the Government Agent, Central Province, are as follows :—

The principal irrigation works in the Kandy District are :—

(1) Amunuwela-amuna in Harispattu
(2) Wirapitiya-ela in Lower Dumbara.
(3) Udugoda Bandara-ela in Lower Dumbara.
(4) Teldeniya Wahala-ela in Lower Dumbara.
(5) Siyambalagastenna-ela in Lower Dumbara.
(6) Palliyawela-amuna.

No large irrigation work was undertaken in this district during the year. A proposal was made to construct an anicut at Amunuwela at a cost of Rs. 4,893, but the work has been shelved for the present, as the villagers have not yet paid the last instalment due by them for previous works.

Surveys have been undertaken in the case of Amunuwela, Udugoda Bandara-ela, and Siyambalagastenne-ela.

A proposal is under consideration for the improvement and repair of Teldeniya Wahala-ela at a cost of Rs. 706. The cultivators have agreed to pay a rate of 50 cents per acre in perpetuity.

Weerapitiya-ela and Udugoda Bandara-ela were breached during the year, and estimates have been prepared for their repair at a cost of Rs. 767 and Rs. 3,243 respectively.

67. The Sub-Inspector for the Kandy District reports that there are 57 minor works in that district, and that he inspected them all and made two surveys, and that there are no irrigation rules for the carrying out of the maintenance and repair whereby the headmen and shareholders can be made to do work when it is required.

68. The Assistant Government Agent, Nuwara Eliya, reports :—

The Ma-ela, which is the only irrigation work of the district accomplished under the provisions of the Irrigation Ordinance; it is 6 miles long, and benefits a large extent of country, and its further improvement, for which an estimate has been made, is very necessary.

The Waduwawala-ela, 4 miles long, which irrigates the hillsides opposite to the Bodi-ela. This ela is in very bad order, and the cultivators under it refuse to pay for its improvement. The only alternative is a rigorous enforcement of the irrigation rules until the ela is in proper working order.

The Mulahal-ela, 3 miles long, to which the same remarks apply, though perhaps in a less degree.

The Lamasuriyagama-ela, which the villagers are anxious to see extended and improved. They asked for the work eight years ago, and it is now three years since they guaranteed repayment of the cost. The scheme is still in "under consideration."

The irrigation headmen are unremunerated, and it is not easy to get satisfactory work out of them.

The irrigation rules are each year being more systematically enforced. There are irrigation channels all over the district kept up under these rules, and many of them would largely benefit by small works of improvement being carried out upon them. The first difficulty is to get the shareholders to consent to pay, the second is to get the money advanced and the work carried out after their consent has been obtained. In two and a half years I have not succeeded in getting a single work carried out.

The year was an unusually wet one, and the water supply was good throughout. Both maha and yala crops were above the average.

69. In the Matale District the following extracts from the Irrigation Inspector's report are interesting:—

Earthwork.—The amount of earthwork done on village tanks during 1902 was 10,737 cubes (39,767 cubic yards). Not only was the earth merely put on the bund, but on some tanks the bunds were turfed, gravelled, and fenced in. A great deal of earthwork was done on two new tanks, viz., Moragolla Mahawewa and Talagiriyagama Mahawewa. On the former 1,028 cubes (3,808 cubic yards) were done in two months by the villagers and the two breaches filled. The work on this tank was started on the 15th August, and by the 15th October there were 4 feet of water in the tank. On the latter tank 414 cubes (1,536 cubic yards) were put into the breach, but it was not enough, and it unfortunately gave way by the water overtopping it. Most satisfactory work was done on Naula tank, which is now practically completed.

Tanks.—The number of village tanks on the list is 148. This does not include the two restored by Government, viz., Pelwehera and Karawilahena. With these two the total is 150. Besides the 150 tanks there are 5 amunas and 2½ miles of channel to look after. The amunas are the Elahera head sluice, Bowetenna and channel, Nadeniya, Wiragahapellessa, and Kurukolayaya.

Sluices.—The following tanks were sluiced during the year:—Ilumbakarawila, Kottakittigewewa, Galkotuwewa, Pahalawewa. Cement pipes were also issued to a number of tanks which were short, and all the pipes in stock were used up.

Surveys.—A survey of all the irrigable land under Moragolla Mahawewa was made in July, costing Rs. 28·80. The extent was nearly 90 acres. The Dorawalagala survey was taken in hand, but owing to the wet weather was not completed. Channels were traced under Pelwehera, and an estimate sent in showing the cost of cutting the same.

The headmen, as a rule, did not display much active interest in irrigation, except in the Kandapalla korale, where the Korala proved of great assistance, and not only showed energy himself, but infused considerable energy into the villagers. This accounts in some measure for the small default in his korale.

The fields under every tank almost were cultivated and yielded good crops, especially in Kandapalla korale.

North-Central Province.

70. The following is from the report of the Government Agent:—

Nuwarakalawiya Village Tanks.—There are 1,428 village tanks under supervision in Nuwarakalawiya. In 1901 there were 1,419; the remaining 9 have been added during the year. Of these 1,428 tanks, 580 are in Nuwaragam palata, 464 in Hurulu palata, and 384 in Kalagam palata; 825 are completed or nearly so, 603 are in various stages of restoration.

At the beginning of the year these tanks were in charge of one Chief Irrigation Inspector, one Inspector, and four Sub-Inspectors. The Chief Inspector had general charge of the whole district, the Inspector had the Kalawewa Yoda-ela and some 97 tanks to look after, and each of the Sub-Inspectors had the immediate supervision of an average of rather more than 332 tanks. This did not include minor Crown tanks being restored on permits, which are also in charge of the village tank staff and will be referred to later.

Although a very large quantity of earthwork had been reported to have been done each year, it was found that the number of tanks completely restored did not increase to anything like the extent which might have been expected had the earthwork been properly applied. Many tanks had been under restoration for twenty-eight years or even more, and yet were not complete. Very few tanks, if systematically restored, should require more than ten years for full completion. No doubt this unsatisfactory state of things was due to trying to cover too much ground, and to entrusting each tank officer with a far larger number of tanks than he could look after properly. It was accordingly decided to concentrate the four Sub-Inspectors in one palata, and to make an effort to secure the final completion of all tanks in it which had been under restoration for ten years or upwards and were not yet complete. The Hurulu palata was selected for this purpose, chiefly for two reasons: (1) because there are no railway or large irrigation works going on there, and there is therefore no demand by Public Departments for village labour; and (2) because, being more remote, the supervision there had been less effectual than in other palatas, and the work of restoration was more behind hand. 285 out of the 464 tanks in the palata came under the class which was to be specially dealt with.

Resolutions were passed by the various Village Committees of the palata that the necessary additional earthwork should be performed, and in accordance therewith orders were published, as required by the village rules, specifying the dates on which work was to commence and the quantities to be performed. The bunds were also levelled and pegged out to the proper heights and slopes. These orders met for a time with determined opposition in many of the Sinhalese and all the Moorish villages of Kalpe, Kunchuttu, and Mahapotana korales. This was due mainly to one agitator, who went from village to village inciting the people not to work, and promising to see them safe from any ill-consequences. As it was found that the work did not start at the time ordered, and persuasion having but little effect, prosecutions were entered in the Gansabhawa. Some difficulty was experienced in securing the attendance of the accused, who in many cases disobeyed the summons served on them, but eventually the more prominent offenders were brought up on warrants and fined from Rs. 10 to Rs. 20 each. By this time the reply of Government to a memorial which had been presented against the order calling out labour, that the work must be performed, had been received and published. Then the villagers, particularly the Sinhalese, started work in earnest.

The struggle against the opposition had, however, taken time. It was not until late in July that real work began in the recalcitrant korales, though in the other parts of the palata it had been progressing steadily all along. The work once started was pushed on vigorously until the end of September. From the beginning of October heavy rains set in, filled up the

tanks, and rendered all further earthwork for the year impossible. Yet in the two months during which the people really exerted themselves a very large quantity of work was accomplished, as will presently be shown. Had the season for earthwork been as favourable as in previous years, in which the rains did not commence until November; there is no doubt that the object in view could have been nearly, if not quite, achieved. Considering the uphill task which the tank officers had to face and the early rains, their efforts cannot be regarded as wholly unsuccessful.

The work of restoration will be continued during 1903; it is not anticipated that any formidable opposition will be met with. Many of the tanks are so far advanced towards completion that another year's moderate work will probably suffice, while others on which there was from the first a very large quantity to be done may require a second or even a third year.

It will readily be understood how beneficial this work is to the people. It will not only render their tanks safer from the danger of being breached and fitter to perform with regularity their function of irrigating the fields, but it will relieve the villagers once for all from the now annually recurring liability to perform earthwork, and from the constant vexation of being prosecuted if they make default. Last but not least, it will strike at the root of the corruption and extortion which prevail so long as there is earthwork to be performed, and so long as a small gratification to the Vel-vidane, to the Wewa Lekama, or maybe to the Sub-Inspector himself, will secure immunity from prosecution for non-performance, or at least such evidence as will mitigate the punishment. I have held many inquiries into cases of this sort, but have never yet succeeded in bringing home his guilt to the offender. Naturally bribes are given in secret, and there is no acknowledgment. Yet the complainant always brings up a lot of witnesses prepared to depose that they were present, who invariably break down hopelessly under examination.

The quantity of earthwork performed during the year was 112,396 cubes (416,284 cubic yards), which at 25 cents a cubic yard represents a money value of Rs. 104,071. The corresponding quantity for 1901, a much more favourable year for earthwork, was 400,296 cubic yards, or 15,988 cubic yards less than in the year under review.

Of the total quantity performed in 1902, 68,937 cubes (255,324 cubic yards) were done on the bunds of the 285 tanks in Hurulu palata, which were taken up for special restoration, as described above. In other words, nearly two-thirds of the whole work turned out was contributed by the shareholders of 285 tanks, which represent but one-fifth of the total number of tanks under supervision.

The work in Nuwaragam palata was supervised by the Ratemahatmaya, and in Kalagam palata partly by the Irrigation Inspector, who also had the Kalawewa Yoda-ela in his charge, and partly by Mr. Chelladurai, a new Sub-Inspector, whom the Director of Irrigation sent up in July last at my special request. The total quantity of earthwork done under the supervision of these three officers was 39,930 cubes (147,892 cubic yards).

I greatly regret to have to record that Mr. Chelladurai, who was a most promising officer, died in December from pneumonia.

Owing to the shorthandedness of the village tank staff, the progress made in the issue, under the new conditions described in my last report, of permits to restore minor abandoned Crown tanks, was not so rapid as I had hoped it might be. Before any permit can issue it is necessary that there should be one report from the Chief Irrigation Inspector as to the nature and capacity of the tank, the acreage which it will benefit, its connection with any other tank or system of tanks, the possibility of its submerging existing fields, and so on, and another report from the Ratemahatmaya as to the nature of the jungle upon the bed of the tank and upon the land under it, the claims (if any) to the land affected, and the names of all those willing and entitled to join in the restoration. It not infrequently happens that there are two or more sets of rival applicants for the permit, whose conflicting interests either have to be reconciled or adjudicated upon after inquiry by the Government Agent. If an application passes the ordeal of these reports and is approved as a promising undertaking, a survey of the bund and a plan of it with longitudinal and cross sections, showing its present condition and the quantity and nature of the work necessary for its restoration, have to be made in order to draw up the specification which the conditions require to be embodied in the permit.

It will be obvious that all these preliminaries involve a good deal of hard work in inspection, inquiry, surveying, and plotting, particularly in view of the long distances which have to be coverved in this extensive Province. It was not to be expected that the limited tank staff, with their hands full, as they were, with the work of restoration of the village tanks in Hurulu palata, could devote much special attention to this work. After all, important as the restoration of abandoned Crown tanks is, that of the existing village tanks is even more so, and must take the first place.

As to what has been accomplished in this branch of work, the Chief Irrigation Inspector reports :—

Of the 212 permits issued to restore abandoned Crown villages in terms of the old Circular, 63 permits have already been cancelled either for neglect or for inability on the part of the permit-holders to comply with the demand of a fixed minimum annual work for completing the work within a reasonable period. The restoration of tanks on three other permits has been stopped, as interfering with the proposed Kahalla forest reserve. Of the remaining 146 permits, permits of three tanks have been re-issued under the new Government Circular.

Of the still remaining 143 permits in force, designs and specifications of four of them have already been submitted for re-issue. The requisite levels have already been taken for design, and specification of 13 other tanks and plans and sections are under preparation. Of the still remaining 126 permits, 69 should be cancelled for neglect. Action for the re-issue of the remaining 57 should now be taken and will receive attention in 1903.

Besides, 51 new applications to restore Crown tanks as per the new Government Circular were received during 1902. Preliminary reports for 20 of them have already been made. Sections for design and specification for four of these have already been taken, and plans are under preparation. The rest are to receive attention in 1903. The delay in their disposal is due to the special work in Hurulu palata and the want of hands to take up the survey portion of the work.

What I have written is more than enough to show what a very large concern the tank system of this Province is, and its enormous importance. So far as the indigenous population is concerned, it is beyond comparison their most vital interest. In order to its due development it was imperatively necessary that the irrigation staff should be materially strengthened. Accordingly, representations were made by me with that object, and with the result, I am happy to say, that the staff has been nearly doubled. I must express my obligations to the Director of Irrigation for supporting my appeal, and to the Central Irrigation Board for recognizing the necessities of the case and sanctioning the additional appointments. A second Chief Irrigation Inspector has now been appointed, and the staff of Assistant Inspectors and Sub-Inspectors has been raised from five to seven. One of the Sub-Inspectors, Mr. Dabre, has been placed in special charge of the distribution of water under Kalawewa and the Yoda-ela under the title of Irrigation Superintendent, thus setting free one more officer for purely village tank work. The vacancy caused by Mr. Chelladurai's death has already been supplied. That caused by Mr. Dabre's appointment will be filled as soon as the Director of Irrigation has at his disposal an officer who can speak Sinhalese.

I thus have, or shortly shall have, at my disposal two Chief Irrigation Inspectors, one Inspector, and six Sub-Inspectors. The Province has been divided into two as nearly as possible equal divisions, called respectively, for want of a better name, the northern and the southern, though north-eastern and south-western would perhaps describe them more accurately.

From the commencement of 1903 each division has been placed in charge of a Chief Irrigation Inspector, each of whom will have three Sub-Inspectors under him. The remaining officer—the Inspector—will be specially detailed for surveys of Crown tanks to be restored on permit. The year 1903 thus starts with much better prospects of progress than any previous year has had. I hope not only to continue the restoration of village tanks in Hurulu palata, but also to take up the same work in Kalagam palata. The Ratemahatmaya and the people of the latter palata are anxious to have their tanks finished off, and there appears to be no likelihood of any serious trouble in getting the work done. Good progress should also be made throughout the Province in the restoration of abandoned Crown tanks.

I should not omit to add that the services of the Irrigation Engineers in the Province, a body of highly qualified men, whose special duty is the investigation and restoration of the larger works which are in charge of the Irrigation Department, have always been available in any matter requiring special professional skill.

There has been one instance—the village tank of Elapatwewa in Matombuwa korale—in which extra work done over and above the normal annual quantity has been rewarded by payment in land under section 14 of Government Circular No. 59 of 5th June, 1901. A provisional grant of 10 acres has been allowed. In another case—Karambewa in Ullagala korale—a similar grant is under consideration.

The following communications between tanks have been opened up during the year:—

(*a*) Kuda Kekirawa in Kalagam korale with Maha Kekirawa in Maminiya korale.
(*b*) Palugaswewa with Marasin Hammillewa in Kiralowa korale.
(*c*) Andiyagala with Gambirisgaswewa in Kiralowa korale.

The number of similar connections which might be made is very large, but it is almost impossible to give this important means of improving water supply the special attention which it deserves until the tank restoration now being pushed forward is more advanced. One must restrain one's impatience to see everything made perfect all at once. A sum of Rs. 1,017 was expended out of the Tank Fine Fund and Rs. 36 out of the Yoda-ela Fine Fund on repairs and improvements. The Chief Irrigation Inspector states that he had made arrangements to spend a much larger amount, but that the early rains prevented it.

The masonry spill of Relapanawa tank in Kalpe korale, which was in a ruined condition, was pulled down and rebuilt under the supervision of Mr. Doxat, Irrigation Engineer. The same officer effected radical repairs to the masonry stop-wall, sluice, and spill of Muwa Etagama tank in Kadawat korale. The greater part of the old work was pulled up and replaced partly by cement concrete and partly by masonry in cement. The construction of a new sluice at Maha Diwulwewa tank in Kadawat korale, to replace the old one which had collapsed, was commenced, but work was interrupted by the rains.

The culvert on the Mannar road at the 49th milepost, constructed for the purpose of carrying water across the road to irrigable land on the other side of it, and the repairs and improvements to Ipalogama bungalow were completed under the supervision of the Chief Irrigation Inspector. The votes for maintenance of village tank sluices of Talawa-ela anicut and of irrigation bungalows were expended. The building of stables and other additions to the irrigation bungalows at Ulukkulama, Kekirawa, and Ipologama will be undertaken in 1903.

Proposals for repairs to the spill of Kokkabe tank in Mahapotana korale and for the improvement of the sluice of Tirapankadawela in Kalpe korale were submitted, and estimates have been called for. Proposals for the rebuilding of the spill of Hiriwadunna tank and for repairs to the sluice of Palugaswewa, both in Matombuwa korale, and for a new spill for Kele Hammillewa in Kiralowa korale are under consideration. The questions of improving the spill of Mahamankadawala in Nuwaragam korale and of providing a spill for Ihalakanbindigama in Uddiyankulam korale are receiving attention. The proposal for rebuilding the sluice of Galmaduwa tank in Eppawala korale, which was breached in 1901, was not approved by the Director of Irrigation, who has decided that a cement pipe sluice will suffice. These are only instances of many others of a similar nature which are constantly coming up for disposal.

The manufacture of cement concrete pipe sluices for village tanks was carried on in the factory at Anuradhapura under the supervision of the Chief Irrigation Inspector. There are in all 257 tanks to be sluiced. He reports that the manufacture will be completed in February. Sets of pipes and junction blocks for 128 out of the 257 tanks were transported on estimate No. 131 of 25th June, which provided for the transport of pipes for 148 tanks.

The transport of the pipes for the remaining 20 tanks has been delayed owing to the heavy rains, which rendered cart traffic on village roads impossible. None of the pipe sluices so transported have yet been inserted, owing to the same early rains which filled the tanks. An estimate for the transport of the pipes for the remaining 109 tanks was sanctioned in November, but for the reasons already given no transport could then be effected. The pipe sluices for the whole 257 tanks will be transported and inserted during 1903.

A statement showing the cement concrete pipes in stock on January 1, 1902, manufactured during the year, number issued, and balance in stock at the end of the year, is annexed :—

Owing to the very heavy rains no less than 64 village tanks breached. These nearly all occurred during the first half of December. On the 9th of that month a fall of 5·70 inches was recorded in Anuradhapura, and was at least as heavy in most other parts of the Province. This, coming after a fall of 23 inches in October and 17 inches in November, when the ground was thoroughly saturated and the tanks were already full, had the effect of overtopping the bunds of many tanks, with a breach as the inevitable result. Forty-eight of the breaches are to be attributed to this cause. In some cases the catastrophe was accelerated by the breach of an upper tank. Thirty-two of these cases were tanks not fully restored; 11 were new tanks. In 10 other cases the villagers, seeing that their bunds must be overtopped, cut gaps at the "wana," or spill ends, to avert more serious damage to the central portions of the bunds. Six cases are attributed to leaks. One of the most serious—that of Maha Kekirawa, a large village tank—was due to this cause, rotten roots having been left buried in the bund. In almost all cases cofferdams have been put up across the breaches, and sufficient water for the coming harvest has been retained.

Tamankaduwa.—There were 52 village tanks and 6 small Crown tanks under restoration by the villagers during the year. The number of village tanks is the same as in 1901, but that of the Crown tanks is one less, one having been abandoned during the year. All are in a more or less advanced stage of efficiency, but none are yet fully restored. Forty-four of these are sluiced, and three of them have two sluices each. These tanks have been in charge of the Revenue Officer during the year, subject to the orders of the Government Agent.

Earthwork is performed annually on all of them, and their bunds and spills are kept clear of jungle. The quantity of earthwork done during 1902 was 18,672 cubic yards, or 888 cubic yards more than in 1901. There is a default of 3,816 cubic yards, but the Revenue Officer expects that this will be made good. These tanks were all full at the end of the year. The prospects for next year's harvests are favourable. One tank breached; the water rose in one night and overtopped the bund.

North-Western Province.

71. The following extracts are taken from the report of the Chief Irrigation Inspector :—

The completion of village tanks is greatly retarded in consequence of a few landowners refusing or failing to carry out the earthwork apportioned to them. Such defaulters have been repeatedly prosecuted and fines imposed on them. Even this punishment has not had a deterrent effect, for some of their work yet remains unfinished.

It is a moot point whether the work in default can be done departmentally, and the cost thereof recovered by sale of the lands liable for such arrears.

The following statement shows the quantity of earthwork contributed by landowners on their tanks during the year :—

		Cubes.
1 ...	Wanni Hatpattu	1,000

7 ...	Chilaw District	24,043
	Total ...	110,836

Maintenance of completed Tanks.—It is time that arrangements were made for the proper maintenance and upkeep of the village tanks which have been completed in the Province. For this purpose I would suggest the division of the Province into four or five irrigation districts, not following the existing revenue divisions, but having in view the equalization, as much as possible, of the number of tanks to be put in charge of each officer.

Many of the tanks completed are fast reverting to their former condition for want of proper and intelligent supervision and maintenance. This matter requires early attention and decision.

The Vel-vidanes (irrigation headmen) ought to be made to devote more of their time to the work of maintaining irrigation works, which is a part of their legitimate duties. At the request of the Government Agent I have framed rules for the guidance of these headmen, and have submitted them for his approval.

Tanks breached.—Considering the heavy rainfall of the year, it is satisfactory to know that only 12 tanks out of 1,335 are reported to have breached. Nine of them have already been repaired.

Pipe Sluices.—Fifty-eight tanks were supplied with concrete pipe sluices, a list of which is annexed. I subjoin a statement showing the total number of village tanks in the Province in my charge, the number completed up to date, and the number remaining to be completed :—

Districts.	Total Number of Working Tanks.	Number of Tanks completed in 1902.	Number of Tanks completed in previous Year.	Number remaining to be completed.	Number completed up to date.

Province of Uva.

72. The following is from the report of the Government Agent :—

Village Tanks.—The systematic restoration of village tanks in Lower Uva was continued, and a fair amount of work was done on 32 of these tanks, namely, 16 in Wellassa, 1 in Buttala, 1 in Bintenna, and 14 in Wellawaya. Details are specified below, which give particulars of all village tanks, the restoration of which dates from 1898 :—

Division.	Name of Tank.	Date when Restoration commenced.	Date when sluiced.	Date when completed.	Quantities (in Cubes) of Earth-work done in 1902.

Crown (abandoned) Tanks.—In Bintenna two of these tanks were selected for restoration under the special conditions authorized by Government, namely, Siyambalakota-pelessewewa and Viharegodawewa. On the former 46 villagers agreed to work, the clearing of the bund and spills was completed, and a certain amount of earthwork was done. On the latter 19 villagers agreed to work, the clearing of the bund and spills was completed, and a survey was undertaken of the irrigable lands to be benefited. In the other divisions of Lower Uva the restoration of Crown (abandoned) tanks under these special conditions was not undertaken, since the people were already occupied with the repair of their own tanks, as indicated in the preceding paragraph.

Etimolewewa.—In the division of Buttala at Etimole there are traces of a large irrigation work, which may on further investigation prove to be worth restoring. The approximate area of the tank bed is 2,880 acres, the length of the bund is about 2,500 feet, and the head of water at present spill level when restored will be (say) 21 feet. The catchment area is over 5,000 acres, and the extent of land irrigable is about 9,000 acres. Further details, together with a sketch of the locality, have been furnished to the Director of Irrigation, accompanied by a suggestion that a survey should be undertaken, and that the scheme should be investigated with a view to its being made a Government work. Labour is available within reach, and it will be possible to dispose of all land capable of being asweddumized.

Accounts.—The total expenditure during the year was Rs. 12,878·60, namely, Rs. 752·58 on works of construction, Rs. 5,952·89 repairs, and Rs. 3,040·72 maintenance, all of which is recoverable. The cost of the staff amounted to Rs. 3,132·41. The recoveries during the year amounted to Rs. 2,700·26.

Province of Sabaragamuwa.

73. The following is from the report of the Government Agent :—

Mr. Henman visited and reported on all the irrigation works, on some of which masonry works is required. On the Kaltota channel a good deal of scour had occurred, both near the intake and on the recently built trough. This has been put in order. The cultivators under Uggalkaltota passed a set of rules arranging for systematic cultivation of the various ranges, instead of their old practice of cultivating the whole range at one time and so running short of water. I have also asked to have the boundaries of the lots defined, as people are now overstepping their boundaries in various places, having nothing to guide them. The work done here is very considerable and encouraging.

I wish I could say the same of the Kolonna korale works, which make but little advance. The people have plenty of chena, and it is a matter of regret that the Ratemahatmaya has hitherto failed to increase the field cultivation to any appreciable extent. Under Hingura-wewa the land claim is not yet settled, but I hope to settle this soon.

The land under the Malwatta is fully cultivated, but under the Rakwana-ganga scheme no start has been made. The land has been sold under the first 3 miles, but is not yet cleared. A breach near the intake requires attention.

The system of paying coolies to clear the elas of silt is a difficult one to work. It is hard to get the men to do what they ought. It would be better if such work were handed over to the cultivators under their own rules, but as they pay a rate it is perhaps difficult to get them to take over such work now.

The following appendices accompany this report :—

A.—Statement showing Capacity, &c., of Crown Tanks restored or under Construction or Survey.

B.—Statement showing the Expenditure on the Maintenance of Crown Tanks during 1902.

C.—Summary of Expenditure by Provinces during 1902.

D.—List of the Irrigation Staff corrected up to 31st December, 1902.

Irrigation Department,
Colombo, May 4, 1903.

H. T. S. WARD,
Director of Irrigation.

GENERAL REMARKS.

Observatories and Instruments.—The confined situation of the Colombo shed continues to cause me grave anxiety regarding the reliability of the thermometrical observations. Its close proximity to the walls of buildings which have been erected around it and the consequent radiation of heat from these walls have necessarily a prejudicial effect upon the readings of the instruments it shelters. I trust that its early removal to a more open situation will have the earnest attention of Government.

In consultation with the Director of the Botanic Gardens, a site on the Experimental Station at Gangaroowa was selected in March for the erection of an observatory, the records of which will, it is anticipated, prove of great value, especially as it is intended that simultaneous observations will be taken at Peradeniya as well. At the request of the Military authorities the Kandy observatory, which had for many years stood upon ground owned by the War Department, was removed in September to the vicinity of the new Survey Office in that town.

The self-registering instruments have given every satisfaction during the year ; and it is a pleasure for me to record that the intensity of rainfall derived from the pluviograms has proved of the greatest utility to the Municipality in connection with the drainage of the town.

2. *Remarkable Phenomena.*—The month of November has been remarkable for the number and violence of its thunderstorms in Colombo. Two casualties by lightning occurred on the 5th in the Cinnamon Gardens ; on the 8th four persons were disabled and slightly scorched at Kotahena ; three more casualties occurred on the 9th at Alutmawata, Mutwal ; and close to the spot where they happened a very narrow fissure, 6 ft. deep, was found, the ground having been violently disturbed within a circle 10 inches in diameter and 9 inches deep.

Hail fell on the 1st and 6th of April at Kandy, the storms beginning about 3 P.M. in each case and lasting about 20 minutes. On the 6th the pieces were about one inch in diameter and 1½ inch long.

A very bright meteor was observed at 8.35 P.M. on 11th March. It was reported by several observers to be of a bright blue colour, of abnormally large size, and leaving a conspicuous trail behind it. It exploded with a loud report. Its direction was approximately north-east to south-west.

3. *Weather Characteristics.*—The deficiency in rainfall reported in 1901 has been more than made up for during 1902. The first three months of the year and the months of October and November have been abnormally wet all over the Island. October and November especially show large excess, the most remarkable being 17 inches in October on the west and over 12 inches in November on the east coast above the average. During the year the whole Island has received from 14 to 30 inches more than the average for the past thirty-three years, the only exception being a small patch in the southern part of Uva with 2½ inches of rain less than the average.

The temperature was lower over the whole of the Island during January, February, October, and November. On the other hand, May, June, and September were considerably hotter than their respective averages. During the year it was cooler generally in the northern half of the Island, and slightly hotter in the southern portions. The air pressure was slightly greater than the average over the whole Island, excepting the Southern Province and in the neighbourhood of Puttalam.

The highest pressures since 1870 at Colombo, Trincomalee, and Batticaloa were recorded on 17th February, and the lowest temperature at Colombo (65·2°) occurred on 24th January.

Thirty-four consecutive days without rain were recorded at Colombo between 9th January and 11th February. Rain fell during eighteen consecutive days between 2nd and 19th October and thirteen days between 22nd October to 3rd November, the total amount registered for these two periods being 32 inches, very nearly at the average rate of 1 inch a day.

4. The following tables show the absolute maxima and minima of the temperature and pressure during the year and since 1870 :—

* Barometer reduced to 32° F.

5. *Climate of Ceylon.*—The climate varies considerably in different parts of the Island, both as regards temperature and rainfall. In the lowlands the climate is tropical, but in the mountains in the interior the climate is found equal to many parts of Europe.

The mean temperature for the year 1902 was highest at Mannar and lowest at Nuwara Eliya, being 82·3° and 59·7° respectively.

At Colombo and Kandy the mean temperature was 81·8° and 75·4° respectively.

The *mean daily range* of temperature, *i.e.*, the mean of the daily differences between the maximum and minimum temperatures, was highest at Ratnapura, having been 20·2°, and lowest at Galle, 8·7°.

The differences recorded at Colombo and Kandy were 12·7° and 15·8° respectively.

The *absolute range* or differences between the highest and lowest temperature of the air recorded during the year was greatest at Nuwara Eliya and lowest at Galle, having been 30·7° and 12·5° respectively.

The absolute difference at Kandy was 24·3° and at Colombo 19·0°.

The hottest station, taking the mean temperature of night and day all the year round into account, was Mannar (82·3°). The coolest, Nuwara Eliya (59·7°). Colombo and Kandy were 81·0° and 75·4° respectively.

6. *Meteorological Observatories.*—The sixteen meteorological observatories are distinguished in Table I., which also shows the latitude, longitude, and elevation of the different barometer cisterns above sea-level.

TABLE I.—Latitudes, Longitudes, and Elevations of the Meteorological Observatories.

All stations (with the exception of Ragama, where no barometer has been established) are supplied with the following instruments :—Standard barometer, maximum air thermometer, minimum air thermometer, maximum wet-bulb thermometer, minimum wet-bulb thermometer, solar radiation thermometer *in vacuo*, terrestrial radiation thermometer, anemometer, and rain-gauge.

Besides the above-mentioned stations there are 74 rain-gauge stations reporting their observations monthly to this office; of these 70 are in the wet and 4 in the dry zone.*

The map facing page 1 shows the distribution of these observatories and rain-gauge stations, and by varying depths of colour the mean annual rainfall over different parts of the Island.

SOLAR RADIATION.

The instrument employed at the observatories for determining the equilibrium temperature of solar radiation consists of a sensitive mercurial maximum thermometer, having the bulb and part of the stem covered with dull lamp-black. It is enclosed in a larger glass jacket, from which the greater part of the air has been exhausted. These instruments, which were previously placed on stands about one foot above ground, were in 1885 mounted on stands four feet from the ground, the height now generally employed in meteorological observatories. The effect of this change is that the difference between the solar radiation readings and the maximum in shade has been below the average obtained in previous years at almost all the stations. This is due to the fact that the radiation from the ground and surrounding objects has been diminished by the increased height of the instrument. At the same time the readings are probably much nearer their true values.

The relative amount of solar radiation, or intensity of the sun's rays, is indicated by the difference between the temperature registered by this instrument and that registered by the maximum air thermometer in the shade. For various reasons, however, the temperature indicated by this instrument affords only an approximate measure of the amount of solar radiation that penetrates the atmosphere.

Table II. shows the mean monthly excess of the maximum temperature in the sun over the maximum temperature in the shade, deduced from the observations extending over a long series of years in Ceylon.

TABLE II.—Average Excess of Insolation over the corresponding Maximum Shade Temperature.

Table III. (in appendix) shows the equilibrium temperatures of solar radiation for each month of the year 1902 for all stations, giving the monthly mean of the daily readings, the highest and lowest reading for the month, with the dates on which they occurred, and also the excess of the sun over the shade temperatures.

* The "wet zone" is where the rainfall is over 60 in. in the year; the "dry zone" where the rainfall is less than 60 in.

Table IV., below, shows the variations from the averages of Table II. of the mean monthly excess temperatures of sun over shade in 1902, deduced from Table III.

TABLE IV.—Comparison of Excess Sun (over Shade) Temperature in 1902, with the Averages of Table II.

NOCTURNAL RADIATION.

The thermometer employed for registering the cooling of the stratum of air in contact with the earth, as the result of radiation towards the sky at night, is a sensitive spirit minimum thermometer. It is placed on a pad of non-conducting material (blanket) resting on the ground.

The relative amount of radiation from the earth is indicated by the difference between the temperature registered by this thermometer and that registered by the minimum air thermometer.

Table V., below, shows the mean monthly depression of the minimum thermometer on the ground level below the minimum in shade four feet above the ground, deduced from eight to twenty years' observations in Ceylon.

TABLE V.—Average Depression of Monthly Mean Nocturnal Temperatures below Minimum Shade Temperature.

Table VI. (in appendix) gives the monthly means of the nightly readings, the maximum and minimum readings with the dates on which they occurred, and also the depression below the minimum shade temperature.

Table VII., below, shows the variations from the averages of Table V. of the mean monthly depressions of the terrestrial radiation thermometer below the minimum shade thermometer for 1902, deduced from Table VI.

TABLE VII.—Comparison of the Depression of Mean Nocturnal Temperatures below Minimum Shade Temperatures in 1902, with the Averages of Table VI.

AIR TEMPERATURE.

Table VIII., below, gives the average monthly mean temperatures of stations in Ceylon. The data for the deduction of the mean temperature are obtained from the means of the air temperatures at 21*h*. 30*m*. and 3*h*. 30*m*., and minimum thermometer readings during the twenty-four hours.

Table XII. (in appendix) gives the sea-level equivalents of the mean monthly temperatures in Table IX., omitting hill stations. The reduction to sea-level temperature has been made by adding one degree of temperature for every 450 ft. of elevation.

ATMOSPHERIC PRESSURE.

The barometer used at the Colombo Observatory is a standard, by Negretti & Zambra, which has been compared with the Kew standard. All the barometers at outstations are on Fortin's principle (constructed some by Casella, others by Negretti & Zambra), and have been

compared with the Colombo instrument. At all the stations the instruments are placed in buildings and are preserved, as far as possible, from extremes of temperature.

Table XIII., below, gives the monthly mean barometric readings deduced from observations in Ceylon extending over a series of years.

Table XIV. (in appendix) gives the monthly and yearly means of the daily readings; the monthly and yearly means of the readings at 21*h.* 30*m.* and 3*h.* 30*m.*; the monthly and annual range; the highest and lowest monthly and yearly readings, with the dates on which they occurred; the yearly means of the maximum and minimum readings; and the absolute monthly and yearly range. Table XV., below, shows the variations from the averages in Table XII. of the monthly and yearly means for 1902.

TABLE XV.—Comparison of Monthly Mean Pressure in 1902 with the Averages of Table XIII.

Table XVI. (in appendix) gives the monthly and yearly means of pressure in 1902, according to the tables printed in the "Instructions to Observers at Ceylon Meteorological Stations."

WIND.

The instrument employed at the Colombo Observatory is a self-registering Beckley anemograph. It records the direction and velocity of the wind, continuously, on a revolving drum driven by clockwork. At outstations the instruments employed consist of the ordinary wind-vane for direction, and a Robinson anemometer for registering on a dial the distance travelled by the wind.

Table XVII. (in appendix) gives the number of times that each of eight wind-directions and calms were observed at 21*h.* 30*m.* and 3*h.* 30*m.* by the ordinary wind-vane at outstations; the trigonometrical resultant of these observations, computed by Lambert's formula; and the mean diurnal movement of the air; also the average monthly values of the last two data, computed from as many years as have furnished anemometric registers.

The Colombo anemograph records the number of miles travelled in each of sixteen directions.

HYGROMETRY.

The humidity of the air, the elastic force of aqueous vapour, and the temperature of the dew point are inferred from the relative temperatures of identical dry and wet-bulb thermometers, when exposed to the same conditions. In order that the evaporation of the water from the wet-bulb may take place freely, the instruments are kept in outside sheds: if kept in rooms, the reading of the wet-bulb will not give a true indication, owing to restrained evaporation.

Table XVIII. (in appendix) gives the monthly and yearly means of the readings of the wet-bulb at 21*h.* 30*m.* and 3*h.* 30*m.*; the monthly and yearly means of the minimum wet-bulb; the mean range and the adopted wet-bulb temperature of each month (the mean of the minimum, 21*h.* 30*m.* and 3*h.* 30*m.* readings); also the difference of these several values and the corresponding air temperature.

Table XIX. (in appendix) gives the mean vapour tensions of the several months of 1902, and of those observed at 21*h.* 30*m.* and 3*h.* 30*m.*, and also those deduced from the reading of the minimum dry and wet-bulb thermometers.

Table XX., below, shows the average monthly and yearly mean vapour tension for different stations, deduced from observations extending over a number of years in Ceylon.

CLOUD PROPORTION.

The relative proportion of cloud is determined in the usual manner by estimating the average amount of sky covered, 10 denoting a sky entirely and continuously overcast, and zero a cloudless sky.

Table XXV., below, shows the average proportion of clouded sky in each month, deduced from the registers of past years.

TABLE XXV.—Average Proportion of Clouded Sky in each Month, deduced from the Registers of past Years.

PART III.—JUDICIAL.

JUDICIAL STATISTICS.

REPORT OF THE SOLICITOR-GENERAL ON THE STATISTICS RELATING TO THE ADMINISTRATION OF CRIMINAL JUSTICE IN CEYLON DURING 1902.

IN my Special Report on Crime, printed and published as a Sessional Paper of the Legislative Council (No. VIII. of 1898), I discussed and settled certain general principles relating to the question of the movement of crime, such as the meaning of the term "crime," what is the best index of crime, upon what lines crime should be grouped, and how statistical tables relating to crime should be constructed; and then I considered the following questions, namely :—

(*a*) The increase or decrease of crime in Ceylon ;
(*b*) The geographical distribution of such crime, and the proportion of serious offences in each of the districts to the population thereof ;
(*c*) The state of crime in towns as compared with rural districts ;
(*d*) The tendency to mitigation of sentences ;
(*e*) The previous convictions of criminals ; and
(*f*) Crime in relation to sex, age, and nationality in Ceylon.

2. In the present report I shall adhere to the principles settled as above.

INCREASE OR DECREASE OF CRIME. (Paragraphs 3–20.)

3. The subject of increase or decrease of crime in Ceylon necessitates the consideration of the following questions :—

(1) Crime tried by Village Tribunals ;
(2) Crime tried by Police Courts ;
(3) Crime tried by District Courts ; and
(4) Crime tried by the Supreme Court.

By crime is meant wilful acts of disobedience to the law. (1) and (2) relate to what may be called "ordinary" crime ; (3) and (4) relate to the "serious" crime of the country.

CRIME TRIED BY VILLAGE TRIBUNALS.

Year.	Breaches of Village Council Rules.	Assaults.	Thefts.	Malicious Injuries.	Cattle Trespass.	Maintenance, &c.	Amicably settled in Court.	Total Decided.
1892	15,818	6,918	5,715	1,179	3,305	121	7,326	40,382
1893	14,216	6,260	5,511	922	2,485	60	6,440	35,894
1894	15,778	6,625	5,318	997	2,350	23	7,381	38,472
1895 ...	17,241	6,883	5,600	1,152	2,344	28	6,987	40,235
1896	18,443	6,331	4,292	1,056	2,331	17	7,117	39,587
Annual average for 1892–1896 ...	16,299	6,603	5,287	1,051	2,563	50	7,050	38,916
1897	19,168	7,011	4,619	1,169	2,810	3	8,631	43,411
1898	18,337	7,027	4,340	1,002	2,508	4	7,156	40,374
1899	20,324	6,657	4,183	891	2,946	4	7,151	42,181
1900	23,011	6,574	4,035	1,114	2,260	3	6,757	43,754
1901	21,055	6,082	4,091	1,369	2,038	3	5,453	40,091
Annual average for 1897–1901 ...	20,379	6,670	4,254	1,109	2,512	3	7,030	41,962
1902	21,127	6,291	4,402	1,447	2,115	1	5,831	41,214

4. From this table we learn that the crime which goes for disposal before the Village Tribunals has slightly decreased. According to the rule of proportion of persons tried to population per 100,000 inhabitants, there appears to be a fall (as shown in the following table) from 1,201 persons in the quinquennial period 1892–1896 to 1,192 persons in the period 1897–1901 :—

Quinquennial Period.	Annual Average of Persons tried by Village Councils.	Annual Average of Population for each Quinquennial Period.	Proportion per 100,000 Inhabitants.
1892–1896	38,916	3,240,000	1,201
1897–1901	41,962	3,520,000	1,192

In 1902 the proportion per 100,000 inhabitants was 1,129.

CRIME TRIED BY POLICE COURTS.

5. The following table exhibits the crimes which went before Police Courts for trial (and not committed to higher courts) during each of the years in the period 1892–1902 :—

Summary Offences.

Year.	Offences against the Person.	Offences against Property.	Offences under Labour Ordinances.	Cattle Stealing.	Other Offences.	Total for each Year.
1892	8,714	13,336	472	2,974	27,685	53,181
1893	8,426	12,902	531	3,261	30,852	55,972
1894	20,145	19,581	2,643	3,576	35,324	81,269
1895	19,338	16,980	2,495	3,749	36,807	79,369
1896	16,329	14,512	3,008	2,740	36,032	72,621
Annual average for 1892–1896 ...	14,390	15,462	1,830	3,260	33,340	68,482
1897	17,391	16,121	2,984	3,009	37,175	76,680
1898	14,556	15,322	2,906	2,479	35,963	71,226
1899	15,375	12,813	2,549	2,015	37,226	69,978
1900	16,821	13,950	2,011	2,544	33,434	68,760
1901	16,769	14,543	2,682	2,374	40,659	77,027
Annual average for 1897–1901 ...	16,182	14,550	2,626	2,484	36,891	72,734
1902	16,752	15,740	2,404	2,299	40,127	77,322

In 1902 there were 570 cases more against the person than in the annual average for the period 1897–1901; and 1,190 cases against property more than in the annual average for the same period; and 185 cases of cattle stealing less than in the annual average for the same period.

6. With regard to the total number of summary offences, the quinquennial averages, when brought into relation with the population of the country, show a decrease. For every 100,000 inhabitants there were tried by the Police Courts 2,114 persons during 1892–1896 and 2,066 persons during 1897–1901. The table is as follows :—

Quinquennial Period.	Annual Average of Persons tried by Police Courts.	Annual Average of Population for each Quinquennial Period.	Proportion per 100,000 Inhabitants.
1892–1896	68,482	3,240,000	2,114
1897–1901	72,734	3,520,000	2,066

In 1902 the proportion per 100,000 inhabitants was 2,118.

CRIME TRIED BY DISTRICT COURTS AND THE SUPREME COURT.

7. For the purpose of comparing Ceylon with England, tables of figures (see pages 8 and 9) have been prepared on the model of the English tables, in which the indictable offences tried by our Supreme Court and District Courts (corresponding to the Courts of Assize and Quarter Sessions) are arranged under six classes, viz., (1) offences against the person; (2) offences against property with violence; (3) offences against property without violence; (4) malicious injury to property; (5) forgery and offences against the currency; and (6) other offences not included in the above.

8. Table I. of the Appendix relates to the District Courts, and Table II. of the Appendix to the Supreme Court, and both these tables exhibit the "serious" crime of the country.

OFFENCES AGAINST THE PERSON.

9. The total number of persons tried before all the District Courts of the Island and the Supreme Court for offences against the person in each of the years 1892–1902, together with the annual average for the two quinquennial periods 1892–1896 and 1897–1901, stands as follows :—

	1892.	1893.	1894.	1895.	1896.	Annual Average, 1892–1896.	1897.	1898.	1899.	1900.	1901.	Annual Average 1897–1901.	1902.
District Courts ...	402	417	512	320	640	457	837	885	405	502	694	665	561
Supreme Court ...	226	223	279	214	234	233	334	322	217	251	330	291	236
Total ...	628	640	791	534	874	690	1,171	1,207	622	753	1,024	956	797

The year 1902 shows a fall of 159 cases from the average for 1897–1901.

10. Offences against the person tried by the District Courts and the Supreme Court include (1) grievous hurt and hurt by dangerous means; (2) rape and abduction; (3) murder, attempt to murder, and culpable homicide not amounting to murder. The following table shows the number of persons tried for the first-named group of offences :—

	1892.	1893.	1894.	1895.	1896.	Annual Average, 1892–1896.	1897.	1898.	1899.	1900.	1901.	Annual Average, 1897–1901.	1902.
Grievous hurt ...	123	232	181	128	213	175	415	322	221	166	408	306	252
Hurt by dangerous means ...	257	181	186	141	286	210	298	411	159	253	199	264	196
Total ...	380	413	367	269	499	385	713	733	380	419	607	570	448

11. As regards this group of cases, the annual average for the two quinquennial periods 1892–1896 and 1897–1901 shows a rise from 385 to 570—that is, 185 cases; and 1902 shows a fall of 122 cases from the average for 1897–1901.

12. The table given below proves that for every 100,000 inhabitants there were tried in the District Courts and the Supreme Court for grievous hurt and hurt by dangerous means on an average, in each year of the period 1892–1896 and 1897–1901, 11·88 and 16·19 persons respectively :—

Period.	Annual Average of Persons tried.	Annual Average of Population.	Proportion per 100,000 Inhabitants.
1892–1896	385	3,240,000	11·88
1897–1901	570	3,520,000	16·19

13. As regards the second group of offences, on an average there were tried for each of the years 1892–1896, 19 persons for rape and 5 for abduction, and for each of the years 1897–1901, 26 and 7 persons respectively. In 1902 the figures are 26 for rape and 0 for abduction, as against 17 and 0 for 1901.

14. The following table shows the number of persons tried for the third group of offences, viz., murder, attempt to murder, and culpable homicide not amounting to murder :—

	1892.	1893.	1894.	1895.	1896.	Annual Average, 1892–1896.	1897.	1898.	1899.	1900.	1901.	Annual Average, 1897–1901.	1902.
Murder ...	109	58	76	59	90	71	72	74	42	97	100	77	99
Attempt to murder	7	1	6	2	5	5	12	11	7	12	41	17	30
Culpable homicide not amounting to murder ...	11	42	62	70	24	50	54	39	54	37	82	53	30
Total ...	127	101	147	131	119	126	138	124	103	146	223	147	159

15. The annual average of persons tried for murder, &c., when brought into relation with the annual average of the population for the corresponding quinquennial periods, yields the following results :—

Period.	Annual Average of Persons tried.	Annual Average of Population.	Offenders per 100,000 Inhabitants.
1892–1896	126	3,240,000	3·89
1897–1901	147	3,520,000	4·18

In 1902, as there were 159 persons tried, the ratio per 100,000 is 4·4.

OFFENCES AGAINST PROPERTY.

16. The total number of persons tried before all the District Courts of the Island and the Supreme Court for offences against property (as classified in Tables I. and II. of the Appendix) in each of the years 1892–1902 is as follows :—

	1892.	1893.	1894.	1895.	1896.	Annual Average, 1892–1896.	1897.	1898.	1899.	1900.	1901.	Annual Average, 1897–1901.	1902.
Persons tried ...	660	575	776	608	719	667	1,270	1,121	677	918	1,274	1,052	1,055

There is a rise of 3 cases in 1902 upon the average for the previous five years 1897–1901.

17. Of the persons tried as aforesaid, those tried for burglary, robbery, and theft appear in the following table :—

	1892.	1893.	1894.	1895.	1896.	Annual Average, 1892–1896.	1897.	1898.	1899.	1900.	1901.	Annual Average, 1897–1901.	1902.
House-breaking ...	200	199	210	143	163	183	349	250	162	292	389	288	276
Robbery ...	245	174	316	157	172	213	388	448	245	238	368	337	332
Cattle stealing ...	13	9	26	43	31	24	107	38	25	67	65	60	52
Other thefts ...	75	54	58	124	184	99	206	180	115	199	226	185	197
Total ...	533	436	610	467	550	519	1,050	916	547	796	1,048	870	857

Here we have a fall of 13 cases in 1902, as compared with the average for 1897–1901.

18. The persons tried for forgery and false documents, as shown in Tables I. and II. of the Appendix, number on an average 27 for the quinquennial period 1892–1896 and 39 for 1897–1901. In 1902 there were 29 persons tried under this head.

For coining and uttering counterfeit coin or notes, 18 is the annual average for 1892–1896 and 19 for 1897–1901. In 1902 there were 28 persons tried under this head.

For riot and unlawful assembly, the annual average is 81 persons for 1892–1896 and 120 for 1897–1901. In 1902 there were 90 persons indicted for these offences.

Under the head of perjury, the annual average was 15 for 1892–1896 and 22 for 1897–1901. In 1902 there were 17 persons tried for perjury.

ANNUAL MOVEMENT OF SERIOUS CRIME.

19. The following table shows the annual movement of serious crime (or persons tried by the Supreme Court and all District Courts) during each of the ten years ended 1902 :—

	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Murder	58	79	59	90	72	74	42	97	100	99
Culpable homicide not amounting to murder	42	62	70	24	54	39	54	37	82	30
Attempt to murder	1	6	2	5	12	11	7	12	41	30
Grievous hurt	232	181	128	213	415	322	221	166	408	252
Hurt by dangerous weapons ...	181	186	141	286	298	411	159	253	199	196
House-breaking	199	210	143	163	349	250	162	292	389	276
Robbery	174	316	157	172	388	448	245	238	368	332
Theft of cattle	9	26	43	31	107	38	25	67	65	52
Other thefts	54	58	124	184	206	180	115	199	226	197
Rape	19	20	14	27	36	35	17	23	17	26
Coining and uttering counterfeit notes ...	13	14	17	30	38	27	5	10	13	28
Forgery	17	23	27	45	28	51	37	19	57	29
Perjury	20	15	15	9	34	28	16	14	19	17
Riot and unlawful assembly ...	64	99	55	46	164	93	101	115	129	90

SERIOUS CRIME FOR 1902 COMPARED WITH ITS NORMAL LEVEL.

20. The following table shows (1) the *mean* flow of each of the serious crimes therein mentioned during the decade 1892–1901 ; (2) the current of serious crime in 1902 ; and (3) its rise or fall in 1901 in reference to the mean flow or normal level :—

	Annual Average of Persons tried during 1892–1901 (mean flow).	Persons tried in 1902 (current in 1902).	Difference.	
			Rise.	Fall.
1. Murder	78·0	99	21	—
2. Attempt to murder	10·4	30	20	—
3. Culpable homicide not amounting to murder ...	47·5	30	—	17
4. Grievous hurt	240·9	252	12	—
5. Hurt by dangerous weapons	237·1	196	—	41
6. House-breaking	235·7	276	41	—
7. Robbery	275·1	332	57	—
8. Cattle stealing	42·4	52	10	—
9. Other thefts	142·1	197	55	—
10. Rape	22·2	26	4	—
11. Forgery	32·5	29	—	3
12. Perjury	19·1	17	—	2
13. Riot and unlawful assembly	100·8	90	—	10
14. Counterfeit coining	18·2	28	10	—

GEOGRAPHICAL DISTRIBUTION OF CRIME. (Paragraphs 21 and 22.)

21. The following table shows the geographical distribution of *serious* crime (*i.e.*, the crime tried by the Supreme Court and the District Courts). Balapitiya takes the lead for 1902, as it did for 1899, 1900, and 1901 :—

Order in 1902.	Judicial Divisions of the Island.	Proportion of Persons tried per 10,000 Inhabitants. For 1901.	For 1902.	Order in 1901.
1	Balapitiya	21	12·7	1
1	Galle	13·3	12·7	3
2	Chilaw and Marawila	13·7	11·2	2
3	Panadure	10·6	11·1	7
4	Matara	12·6	10·5	4
5	Puttalam	9·2	8·7	8
6	Haldummulla	5·5	8	17
7	Tangalla	7·4	7·3	10
8	Kayts	7·2	7·2	11
9	Batticaloa and Kalmunai	7	7·1	12
10	Kegalla	1·1	6·5	30
11	Colombo	6·9	6	13
11	Gampola	1·4	6	28
12	Trincomalee	8·2	5·4	9
13	Kalutara	11·6	5·2	5
14	Point Pedro and Chavakachcheri	3·5	5	23
15	Mullaittivu	6·6	4·4	14
16	Hambantota	6·1	4	16
16	Matale	5·2	4	18
17	Jaffna and Mallakam	6·2	3·6	15
18	Kandy	11	3·4	6
19	Avisawella	3·3	3·3	24
20	Kurunegala	3·5	2·8	23
21	Badulla	4·4	2·5	20
22	Panwila and Urugala	3·8	2·4	22
22	Ratnapura and Rakwana	3·5	2·4	23
23	Anuradhapura	2·6	2·2	26
24	Negombo	2·9	2·1	25
25	Hatton	4·8	1·4	19
26	Nuwara Eliya	4	1·2	21
27	Mannar	·8	·8	31

22. The following table shows the distribution of *ordinary* crime, which does not seem to bear any relation to the distribution of *serious* crime :—

Order in 1902.	Judicial Divisions of the Island.	Proportion of Persons tried per 10,000 Inhabitants. For 1901.	For 1902.	Order in 1901.
1	Gampola	73	266	16
2	Hambantota	165	149	4
3	Kegalla	18	134	30
4	Galle	99	115	10
5	Trincomalee	119	111	7
6	Colombo	126	96	5
7	Puttalam	105	95	9
8	Matale	98	84	11
9	Chilaw and Marawila	91	81	12
10	Hatton	321	76	1
11	Mannar	66	72	17
12	Kandy	239	71	2
13	Panadure	59	68	19
14	Balapitiya	78	66	15
15	Kayts	78	60	15
16	Kalutara	81	54	14
17	Jaffna and Mallakam	107	53	8
18	Matara	56	52	20
19	Negombo	64	48	18
19	Point Pedro and Chavakachcheri	53	51	22
20	Ratnapura and Rakwana	54	43	21
21	Anuradhapura	39	41	25
22	Kurunegala	43	38	23
23	Panwila and Urugala	41	35	24
24	Mullaittivu	54	33	21
25	Nuwara Eliya and Maturata	123	32	6
26	Batticaloa and Kalmunai	34	30	27
26	Avisawella	29	30	28
27	Badulla	36	23	26
28	Tangalla	185	19	3
29	Haldummulla	83	16	13

CRIME IN TOWNS AND RURAL DISTRICTS.

23. No complete statistics are available under this head. It is time that our Courts should begin to tabulate figures relating to this important subject.

VARIATIONS IN SENTENCES. (Paragraphs 24 and 25.)

24. The following table shows the punishments awarded by Police Courts on persons tried and convicted by them during 1893–1902 :—

Nature of Punishment.	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Fine	11,135	10,024	10,695	13,893	13,201	13,432	15,185	15,325	14,995	16,529
Fine and simple imprisonment ...	9	63	26	13	35	18	14	19	31	23
Fine and rigorous imprisonment ...	51	65	50	50	71	96	54	93	82	91
Simple imprisonment only... ...	57	58	59	72	62	96	73	76	97	110
Rigorous imprisonment only ...	2,718	2,142	2,336	1,902	2,782	3,036	2,640	2,421	2,419	2,122
Bound over	361	669	684	588	505	611	450	687	618	548
Whipping of juvenile offenders ...	463	400	315	292	369	415	347	377	391	367

25. The sentences passed by *all* the courts of the Island appear classified in the following table :—

Sentences.	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Not exceeding 2 weeks	2,261	2,019	1,707	1,807	2,103	2,070	1,871	1,519	1,960	2,395
Do. 1 month	1,681	1,503	1,614	1,511	1,971	1,993	1,803	1,858	1,746	1,567
Do. 3 months	1,151	983	860	792	1,135	1,212	1,066	939	1,096	989
Do. 6 months	976	865	703	434	819	876	734	829	793	630
Do. 1 year	282	309	243	280	365	396	254	284	292	256
Do. 2 years	364	346	292	199	288	255	203	274	281	242
Do. 3 years				19	87	68	60	61	65	66
Do. 4 years				17	18	35	16	47	61	51
Do. 5 years				48	87	59	61	58	125	53
Between 5 and 10 years	57	73	53	76	79	57	52	70	113	73
Over 10 years				8	9	8	11	10	2	4
To be hanged	23	43	26	37	40	28	27	51	47	43

PREVIOUS CONVICTIONS. (Paragraphs 26 and 27.)

26. The following table shows the number of persons convicted once and oftener, exclusive of the Road Ordinance defaulters :—

Prisoners.	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Not previously convicted ...	5,653	4,934	4,429	4,198	5,806	5,971	5,163	4,900	5,382	5,151
Convicted once before	718	717	646	653	703	649	583	600	645	682
Convicted twice before	192	205	157	201	230	197	166	222	255	240
Convicted thrice before	77	105	100	84	104	95	91	100	123	114
Convicted oftener before ...	155	180	166	152	158	139	155	178	176	182
Total ...	6,795	6,141	5,498	5,288	7,001	7,051	6,158	6,000	6,581	6,369

27. The annual average for the quinquennial period 1898–1902 stands as follows :—

Prisoners.	Percentage.
Not previously convicted	82·6
Convicted once before	9·8
Convicted twice before	3·4
Convicted thrice before	1·6
Convicted oftener than thrice before	2·6
Total ...	100·0

If we remember that in England the ratio of persons previously convicted to persons not previously convicted is as 55 to 45, we have reason to be satisfied with our ratio of 17 to 83.

CRIME IN RELATION TO SEX.

28. The daily average of the male and female convicts in all our prisons is shown in the following table :—

	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Males ...	2,467	2,351	2,165	1,975	2,174	2,492	2,330	2,199	2,412	2,380
Females ...	28	30	27	21	30	32	30	32	36	24

CRIME IN RELATION TO NATIONALITY.

29. The following table shows the nationality of those who, upon conviction, were sent to jail :—

	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Sinhalese ...	5,994	5,308	4,804	4,426	5,655	5,147	4,619	4,472	4,911	4,790
Tamils ...	1,302	930	958	1,017	1,220	1,559	1,295	1,224	1,420	1,299
Moors ...	446	474	314	316	422	516	408	383	392	343
Malays ...	79	64	46	41	46	46	34	46	25	38
Burghers ...	48	34	38	38	54	44	33	39	56	37
Europeans ...	14	14	34	38	37	33	21	21	39	47
Others ...	79	43	53	60	67	85	77	75	92	52

The 47 Europeans convicted in 1902 were non-residents.

30. The ratio of the prisoners of each race to 100,000 of its population stands as follows :—

	Population.	Annual Average of Prisoners, 1898-1902.	Ratio per 100,000, 1898-1902.
Sinhalese	2,330,807	4,788	205
Tamils	951,740	1,359	142
Moors	228,034	408	179
Burghers	23,482	42	179
Malays	11,902	38	311

Colombo, 15 June, 1903.

P. RÁMANÁTHAN,
Solicitor-General.

APPENDIX.

I.—Table showing the Number of Persons committed for Trial and Nature of Offences (Indictable) in each Year from 1892-1902 before District Courts of Ceylon.

REPORT OF THE CROWN COUNSEL, WESTERN CIRCUIT, FOR 1902.

I HAVE the honour to submit the return of cases disposed of in the Western Circuit during the year 1902.

2. A reference to Table A shows that there has been a marked reduction in the number of cases committed for trial before the Supreme Court compared with the two previous years, but, on the other hand, there has been an increase in the number of cases committed for trial before the District Court.

3. The total number of cases, however, committed for trial before the District Court and Supreme Court in 1902 is less than the total number of cases committed in 1901.

4. Tables B and C show that there has been a decrease in the number of cases of murder and culpable homicide not amounting to murder, as compared with the years 1900 and 1901. The number of murder cases is still in excess of any other offence tried by the Supreme Court.

5. From Table D it appears that the greater number of cases have been committed for trial before the District Court of Colombo.

L. MAARTENSZ,
Crown Counsel.

Colombo, April 24, 1903.

ANNEXURES.

A.—Return of Cases referred to Crown Counsel in the Western Circuit during the Years 1897 to 1902.

Year.	No. of Cases committed for Trial: Before Supreme Court.	Before District Court.	No. referred to Police Courts.	No. in which Accused were directed to be discharged.	Total No. of Cases disposed of.	No. pending at end of Year.

REPORT OF THE CROWN COUNSEL, MIDLAND CIRCUIT, FOR 1902.

I HAVE the honour to submit the returns of cases disposed of in the Midland Circuit during the year 1902, Mr. Templer who had charge of the circuit during the year in question having gone on leave before the returns had been tabulated.

2. A reference to Tables A, B, and C indicates that there was an appreciable decrease in the number of cases tried before the Supreme Court as compared with the year 1901, and that there was also a decrease in the number of homicide cases, there having been only 34 of these, in 26 of which convictions were obtained—a highly satisfactory result.

3. There was a noticeable falling off in the number of cases of robbery with violence during the year 1902; there were only 8, as against 20 in the previous year, but the percentage of convictions was small, for out of 27 persons tried only 7 were convicted.

4. There was scarcely any difference between 1901 and 1902 in the number of cases tried and of convictions obtained in the District Courts, but Tables D and E show that the number of cases tried in the District Court of Kurunegala during 1902 (58) was exactly double the number tried in 1901 (29), and that only once before, since 1896, has there been anything like as large a number of cases in that court.

5. Taken as a whole, I think the returns may be considered as very satisfactory.

HERMANN A. LOOS,
Crown Counsel.

Colombo, April 8, 1903.

ANNEXURES.

A.—Return of Cases forwarded to Crown Counsel, Midland Circuit, during the Years 1897 to 1902.

REPORT OF THE CROWN COUNSEL, NORTHERN AND SOUTHERN CIRCUITS, FOR 1902.

I. HAVE the honour to forward a brief report of the criminal work in the Northern and Southern Circuits during the last year.

It will be seen from the accompanying tables that though there has been on the whole a decrease in the amount of crime in the Northern and Southern Circuits last year, the difference between that year and the year 1901 is very slight, and it cannot be said, therefore, that there has been much improvement as regards crime in those two circuits.

3. Cases of culpable homicide not amounting to murder, as well as cases of murder, are still very numerous, but by far the larger number of them occurred in the Southern Province. The number of murder cases and the number of persons convicted of murder in the Southern Circuits were thirty-three times larger than those in the Northern Circuit, and nearly thrice the number convicted in 1901 were convicted last year.

4. In respect of the crimes of forging notes and uttering counterfeit notes, the Northern Circuit compares most favourably with the Southern, for, while there were 11 such cases in the Southern, there was not one in the whole of the Northern Circuit, and not a single person in that circuit was convicted of forgery of any description or of uttering any forged document.

5. The inhabitants of the Northern and Eastern Provinces of the Island are given to rioting to a far greater extent than those of the Southern. Last year there were four cases of riot, and fifty-six persons indicted for that offence in the first two Provinces; whereas there were no cases of the kind in the Southern Circuit. It is said that these riots in the North are due to the sudden revival of caste prejudices and caste distinctions. Certainly nine-tenths of the cases that have passed through my hands were due to people of some caste venturing to exercise some privilege, which in the caste system is possessed only by persons of a higher caste, such as the wearing of jewellery, the beating of tom-toms in processions, the use of umbrellas, and so on.

6. Grievous hurts and robberies are still far too prevalent in both circuits, and house-breaking in the Southern. House-breaking seems to be the crime of most frequent occurrence in the latter circuit.

7. On the whole, the comparison of the two circuits is distinctly in favour of the Northern, and shows that there is more than twice as much crime in the South as there is in the North.

WALTER D. DRIEBERG,
Acting Crown Counsel.

Colombo, May 18, 1903.

ANNEXURES.

POLICE.

REPORT OF THE INSPECTOR-GENERAL OF POLICE FOR 1902.

THE authorized strength on 31st December, 1902, was 4 Superintendents, 6 Assistant Superintendents, 27 Inspectors, 9 Sergeant-Majors, 222 sergeants, 1,484 constables, 1 drill instructor, 1 registrar of servants, 59 clerks, 1 storekeeper, 1 lockup-keeper, 4 magazine-keepers, 10 coolies, and 1 apothecary, being a total of 1,830.

2. The total cost of the Ceylon Police in 1902 was Rs. 738,014; the cost in 1901 was Rs. 730,840.

3. Major L. F. Knollys, C.M.G., went on three months' leave on the 17th May, 1902, preparatory to retirement from the Service, and Mr. John Rudd, Superintendent of Police, acted as Inspector-General during his absence on leave. I assumed duties as Inspector-General of Police on the 17th August, 1902. Mr. L. Holland, Superintendent of Police, Headquarters, retired on pension on the 22nd September, 1902, after a service of 29 years, and Mr. C. L. Tranchell, senior Assistant Superintendent, was appointed provisionally to succeed him. Chief Inspector Collette also retired on 19th April, 1902. Inspector J. Elstone was appointed on 8th August, 1902, as Acting Assistant Superintendent of Police, and was attached to the Colombo Division.

4. During the year 1 Sergeant-Major, 7 sergeants, and 23 constables retired on pension or gratuity; 1 sergeant and 49 constables were dismissed; and 38 constables were discharged from the force as being unsuitable for the duties of police officers.

5. The police stations established in connection with the prisoners of war at Welimada and Haputale, in the Province of Uva, and Kelaniya and Ragama, in the Western Province, and maintained by the Imperial Government, were abolished in consequence of the removal of prisoners of war from the Island.

6. There was a serious outbreak of prisoners at the Mahara Jail on 28th June last. The police guard, which consisted of 2 sergeants and 9 constables, was found to be unequal to such an emergency, and it was increased to 3 sergeants and 21 constables. This guard has subsequently been replaced by a special Malay guard consisting of 3 sergeants and 24 constables.

7. A scheme for the improvement of the force with an increase of pay is now receiving the consideration of Government.

8. Tables A in the Appendix give summary of cognizable offences disposed of by the Police, District, and Supreme Courts. Table B is a summary of Tables A. It gives the number of the cases of cognizable offences.

9. A reference to Table B will show that there were 17,374 true cases committed in 1902. Of these, 12,229 resulted in convictions in the Police Court or were committed to higher courts.

10. The true cases and results for the last five years have been—

	True Cases.	Convictions or Committals.
1898	15,312	10,673
1899	14,434	10,173
1900	17,703	12,990
1901	17,690	12,793
1902	17,374	12,229

Of the 17,374 cases, 12,901 appear under the head of "Other Offences," which include statutory offences, breaches of Municipal and other by-laws, and other minor offences, leaving 4,473 cases of what may be considered as crime. In 1901 the "Other Offences" amounted to 13,128, leaving 4,562 cases of crime. There has therefore been a decrease of 89 cases of crime.

11. The following table gives a ready means of comparison of serious crime for the past five years :—

	1898.	1899.	1900.	1901.	1902.
Murder and homicide ...	127	125	146	160	146
Rape	38	39	32	36	22
Robbery ...	312	269	289	382	326
Burglary ...	638	977	1,245	1,384	1,433
Grievous hurt ...	500	371	391	441	447
Theft of cattle and prædial produce ...	1,076	885	1,119	1,127	1,185
Arson	Not available...	145	98	148	156
Riot ...	do.	14	3	10	16

12. The convictions in the Superior Courts for the past five years are as follows :—

	Supreme Court.	District Court.
1898	375	763
1899	279	452
1900	328	611
1901	468	646
1902	268	611

13. It should be noted that in 1902 194 cases were sent to the District Court and 28 cases to the Supreme Court under the Habitual Criminals' Ordinance. Had there not been previous convictions of the offenders, these cases would have been disposed of in the lower courts.

14. Of the 146 cases of murder and homicide shown in Table B, 120 cases were committed for trial, and 118 cases were tried in the Supreme Court. In 83 cases the accused were convicted, and 40 persons were sentenced to be hanged, of whom 30 were executed.

15. In 60 cases a knife or other cutting instrument was used, compared with 57 in 1901. In 24 cases clubs were the instrument, compared with 21 cases in 1901; and in 30 cases the victims were shot, compared with 27 in 1901. The use of the gun or pistol as a means of murder is increasing, and it is now premature to express an opinion on the deterrent effects of the Firearms Ordinance, which came into operation early in 1902.

16. With regard to the special offences dealt with in Table B, burglaries show an increase of 49 cases. Grievous hurt, arson, and riot show slight increase. Theft of cattle and prædial produce also show an increase. There were 1,097 cases of theft of cattle with 267 convictions, and there were 88 cases of theft of prædial produce with 49 convictions.

17. As regards minor offences, there were 10,535 convictions for 12,901 cases, including 124 convictions for 193 breaches of Ordinance No. 3 of 1897 (prevention of plague).

Western Province.

18. There has been a decrease in murders and homicides, grievous hurt, and house-breaking by night. Theft of cattle and prædial produce show an increase. There has also been a slight increase in cases of arson.

Under Ordinance No. 3 of 1898 there have been 22 prohibitives from wearing knives during the year; there have been no prosecutions for violation of orders made under sections 21 and 25, nor have any applications been made to the Government Agent for a license under section 26.

There was a proposal to transfer a portion of the Western Province to the Colombo Division soon after my assumption of duties. I wrote to the Government Agent in charge of Police, Western Province, inquiring whether such a transfer would be advisable. He replied on the 20th October, 1902, that the returns showed a considerable decrease in crime during the twelve months June, 1901, to May, 1902, as compared with the previous twelve months, and that he did not recommend the transfer of the villages to the Colombo police, as he did not think that an improvement commensurate with the increased cost would ensue.

Rewards amounting to Rs. 230 were granted to members of the police force in this Province for special good services during the year.

Central Province.

19. In this Province there have been 15 cases of murder and homicide, compared with 19 in 1901. Robbery, grievous hurt, and theft of cattle and prædial produce show an increase, while there has been a decrease in cases of house-breaking by night and of arson. There were only three cases in which the wearing of the knife was prohibited under Ordinance No. 3 of 1898.

The new police stations at Agrapatana and Dimbula have been completed and are being occupied. A scheme for the better housing of the police in Kandy is under the consideration of Government. New police barracks at Matale are in course of construction, and are expected to be completed in 1903.

Rewards amounting to Rs. 690 were paid to members of the force from the Reward Fund.

Northern Province.

20. In this Province murders and homicides show an increase from 4 in 1901 to 7 in 1902. Of this number, 3 were committed for trial in the Supreme Court. There has been a satisfactory decrease in respect of all other offences.

A punitive police force consisting of 1 sergeant and 6 constables was stationed at Nirvali in the Jaffna District in consequence of a disturbance and the wanton destruction of a Catholic church by the villagers. In this connection the Government Agent in charge of Police observes that the effect of this single instance in which punitive police was quartered in a village can hardly be expected to be apparent yet.

Rs. 45 were paid from the Reward Fund to police officers in this Province.

Southern Province.

21. In this Province there were 35 cases of murder and homicide, while in 1901 the number of cases was 30. There were 34 committals in these cases. Robberies show a decrease, while house-breaking by night and theft of cattle and prædial produce continue to increase. Minor offences show an increase.

The coal shed barracks have been condemned as unhealthy, and steps are being taken to remedy this evil.

Ninety-three persons were prohibited during the year from carrying knives under Ordinance No. 3 of 1898. The total number of persons thus prohibited amounts to 490.

The punitive police quartered at Ambalangoda in November, 1901, in consequence of a disturbance, were only removed in November, 1902. In this connection the Assistant Superintendent of Police, Southern Province, remarks that the effect of quartering the police in the village has been most satisfactory. The village is restored to perfect order, and the people, who had previously organized themselves into a body to defy the authorities, have become more amenable to reason.

Rewards paid to police officers in this Province during the year amounted to Rs. 645.

Eastern Province.

22. The return of crime for this Province is small. There were two cases of murder. In the one the victim was deliberately stabbed to death; the assailant was tried, convicted, and sentenced to be hanged. In the other a young temple servant was shot in cold blood, and the motive for this dastardly act is still obscure. Probably the murderer was a tool in the hands of others. The case is still *sub judice*.

Three persons were prohibited from carrying knives under Ordinance No. 3 of 1898.

The punitive police stationed in Navatkuda and Nochchimunai on 1st December, 1901, were withdrawn on 1st August, 1902.

Rs. 15 were awarded to police officers in this Province from the Reward Fund.

North-Western Province.

23. In this Province murders and homicides have decreased from 25 in 1901 to 21 in 1902. In the 21 cases there were 19 committals. There was also a decrease in cases of house-breaking by night, but robberies and theft of cattle show an increase. Minor offences continue to increase.

Rs. 90 were awarded from the Reward Fund to police officers in this Province.

North-Central Province.

24. The return of crime for this Province for 1902 is, as usual, very small, and it is satisfactory. There were only 98 cases in 1902 as compared with 144 in 1901.

Province of Uva.

25. There is a marked improvement in the crime return for this Province for the year 1902. All offences except house-breaking show a decrease.

Rs. 40 were awarded to police officers from the Reward Fund.

Province of Sabaragamuwa.

26. The return of crime shows an increase in cases of robbery. All other offences show a decrease.

Rs. 30 were paid from the Reward Fund to police officers in this Province.

Colombo.

27. I attach the report of the Superintendent of Police, Colombo, which deals with crime and offences in the capital of the Island.

The work done in the identification offices throughout the Island is given in Table C. This work is carried on under the supervision of the Superintendent of Police, Colombo.

During the year under review 5,812 persons were brought to the offices of identification or measured in the prisons by the police identification officers, against 5,982 in 1901. Of these, 1,005 were found to have been previously convicted. In 1901 the number was 939. 222 were tried by higher courts, against 181 in 1901. There were 197 criminals under sentence of police supervision, of whom 42 failed at some time during their sentence to report themselves. Of these, 24 were arrested and punished by the Police Courts. 22 persons were convicted of a crime while under police supervision. 85 convicted persons were at large on license, of whom 13 failed to report themselves. Of these, 7 were arrested and punished. Nine persons were convicted of a crime while at large on license.

The Servants' Registration Ordinance has worked satisfactorily during the year. Table D gives a record of the work for 1902.

I append a memorandum (Statement H) on the work of enlisting, which has been carefully done at the Colombo Depôt by Mr. C. L. Tranchell, Acting Superintendent of Police, Headquarters, who personally selects recruits for enlistment.

A. DE WILTON, MAJOR,
Inspector-General of Police.

Colombo, April 2, 1903.

REPORT OF THE SUPERINTENDENT OF POLICE, COLOMBO, FOR 1902.

THE total number of cognizable cases instituted in the Police Court, the Additional Police Court, the Municipal Court, and the Joint Police Court, for offences committed within Colombo during the year, amounted to 8,105. Of these, 924 are classified under the following heads :—

(*a*) Cases of a civil nature in which the accusation has been made under a misapprehension of law or fact, and cases in which it has not been established that any criminal offence has been committed	722
(*b*) Cases which appear designedly false and in which no offence has been committed	202

Of the remaining 7,181 cases, 6,490 consisted of purely statutory and Municipal offences, *e.g.* drunk and disorderly, nuisance, molestation of passengers, wasting water, &c. The real crimes actually committed amounted to 691.

Table I.

All Cognizable Offences for 1902, as compared with 1901, 1900, 1899, and 1898.

Year.	Classed under A.	Classed under B.	Classed under C.	Statutory Offences actually committed.	Real Crime actually committed.	Grand Total.
1902	722	202	—	6,490	691	8,105
1901	552	293	1	6,870	657	8,373
1900	550	311	1	6,291	761	7,914
1899	452	213	1	4,639	793	6,098
1898	477	556	5	4,253	1,372	6,663

This table gives a comparative statement of the cognizable offences for the years 1898, 1899, 1900, 1901, and 1902. From the figures it will be seen that within the last five years Colombo has become less criminal, whilst the Municipal rules have been more strictly enforced.

This table gives the number of cases relating to offences arising from criminal entry upon property in the occupation or possession of another. This is in every way a most satisfactory statement. It shows that house-breaking and kindred offences have during the last five years been steadily reduced, and that the working of the police in Colombo has been attended by increasing success in each successive year.

During the third and beginning of the fourth quarter of 1902 an epidemic of house thefts and house-breakings broke out in the European residential quarters. It was confined chiefly to the Kollupitiya division, including the Cinnamon Gardens subdivision. The result was an unusual scare, which was without doubt taken advantage of by many servants to appropriate their masters' property while they laid the blame on an unknown "burglar."

The house thefts were an entirely distinct class of offence from the house-breakings. They were committed in most cases by some three or four boys between the hours of 1 and 4 in the afternoon. Their *modus operandi* was simple. Armed with a fictitious letter they boldly entered the compound and walked into the house. As a rule, at this hour the front part of a bungalow in

Colombo is entirely unoccupied, and the silver and brass articles invitingly spread on small tables afford an easy and tempting prey to a thief. In the event of the thief's presence being discerned he at once produced the letter and asked whether Mr. "Smith" or "Jones" lived there, knowing full well that he did not. These house thefts were eventually completely stopped.

The series of house-breakings was entirely due to one man, Saladurage Allis Appu. On his detection, arrest, and conviction for house-breakings by night at the Prince's Club and at Mr. Rae Sands' the house-breakings entirely ceased, and there has been no recrudescence.

The patrol system has been considerably extended. In addition to the divisional patrols which work within the subdivisions, and to the round and bicycle patrols which work along certain prescribed routes, a fresh system of patrols was inaugurated consisting of 3 police sergeants and 12 police constables under the direct control of Inspector Ludovici. Results have now incontrovertibly proved that for night work a well-regulated patrol system in conjunction with a reduced number of beats is far more effective than a system which consists of beats alone.

The so-called burglar scare will not have been without benefit to society, if only it has taught a wholesome lesson and impressed on the minds of householders that it is their incumbent duty as members of the social community to take proper steps to protect their own property, and not to leave it so insecurely placed as to be a temptation to every needy person who passes. Individual precaution must supplement State protection. It is not possible for a constable to be placed in every street, much less in every compound. A warning is also necessary to the employers of domestic servants to prevent their servants from gambling on their premises, and from getting into the debt of the Pathan cloth seller, money lender, and usurer.

With regard to receivers, there is no monoply. It appears that even the most respectable persons are ready to receive articles below their real value and to ask no questions. As long as a low general moral tone with regard to "receiving" exists, thieving will continue, a market always being open for stolen property. Some degree of success has favoured the police action in this respect, and among others a pawnbroker of Kotahena, one of the receivers of Allis's stolen property, was convicted and sentenced to six months' rigorous imprisonment.

There were two cases of criminal breach of trust by carters with regard to loads of tea belonging to Messrs. Skrine & Company and the Galaha Tea Estate Company. In both cases the police succeeded in securing convictions, but in neither of them were they able to trace and recover the stolen property, as information of the loss was not given until the expiration of two whole days, during which time identification had been rendered a physical impossibility. In both cases unknown carters, picked up in the street, were entrusted with valuable consignments. In neither case was any person sent in charge, nor was there any person at the wharf appointed to receive, check, and immediately report the safe arrival of the tea.

Inspector T. P. Attygalle has been singularly successful in making several raids and securing the convictions of the forgers of currency notes. In Police Court case No. 73,427 (Supreme Court No. 2) the accused, Edo Sinno, was convicted of uttering forged notes at the General Treasury, and was sentenced to five years' rigorous imprisonment. In Police Court case No. 76,277 (Supreme Court No. 24) three men were convicted of forging notes at Darley road, and given sentences varying from five to ten years' rigorous imprisonment. In Police Court case No. 77,413 (Supreme Court No. 8) G. Weerakoon was convicted of being in possession of forged notes and of instruments for forging. He received sentences amounting in all to twelve years' rigorous imprisonment.

Section 309, Concealment of birth ...	—	—	—	—	—	—	—	
Total ...	—	7	2	10	—	82	101	81·19
Section 302, Attempt to commit suicide ...	2	—	—	—	—	6	8	—

The total number of offences against persons is 101, as against 106 in 1901, 136 in 1900, 105 in 1899, and 97 in 1898. The percentage of convictions is 81·19 in 1902; it was 87·73 in 1901, 83·82 in 1900, 75·24 in 1899, and 71·01 in 1898.

There have been 9 cases of suicide and 8 attempts, as against 11 cases and 7 attempts in 1901 and 12 cases and 10 attempts in 1900.

The return shows seven committals for murder. The cases of actual murder were four, in all of which convictions were obtained. In two of the other cases verdicts of culpable homicide not amounting to murder were brought in. In the remaining case the accused was convicted of having voluntarily caused grievous hurt.

During the year 106 cases were instituted for unlawful gaming and 97 convictions were obtained; the fines inflicted amounted to Rs. 1,356·25.

The molestation of passengers by unlicensed guides and street loafers has considerably diminished, but it still continues. There were 335 prosecutions, with 319 convictions, under the Ordinance.

The necessity for the licensing and registration of ricksha coolies still exists. There are some of the very worst characters among these men, and their opportunities for committing crime are considerable.

The work of the identification of habitual criminals has continued to be successfully carried out by Inspector Altendorff. The following are the particulars :—

Supervision of Habitual Criminals.

No.	Particulars.	No.
1	Number of habitual criminals under police supervision in Colombo town during the year 1902	66
2	Number of habitual criminals at large on license in Colombo town during the year 1902	24
3	Number of habitual criminals included in item 1, who failed to report themselves and were prosecuted	7
4	Number of habitual criminals included in item 1, who failed to report themselves and were not traced	4
5	Number of habitual criminals included in item 1, who were convicted of a crime whilst under supervision	9
6	Number of habitual criminals included in item 2, who failed to report themselves and were prosecuted	3
7	Number of habitual criminals included in item 2, who failed to report themselves and were not traced	2
8	Number of habitual criminals included in item 2, who were convicted of a crime whilst on license	5
9	Number of re-convictions of habitual criminals during 1902	79

The supervision of habitual criminals and suspicious characters has received special attention during the year. The divisional system in vogue, while possessing certain advantages, has the great disadvantage of limiting the number of habituals known to each supervising constable. To remedy this a scheme has been introduced for the inspection of criminals by the supervising constables at the jail previous to discharge. In this way each constable will considerably improve his knowledge and acquaintance of the criminal population. The introduction of photography would, too, be of considerable assistance. The known habitual criminal population of Colombo is yearly increasing, and effective supervision is rendered yearly more difficult. The great advantage to be derived from the system is that the exact state of the criminality of a district can be estimated, and steps can therefore be taken by the Legislature in time to counteract any serious danger to society.

The question of what is to be done with the professional and habitual criminal is receiving considerable attention in England, America, and elsewhere. States are realizing the necessity of devising some new form of detention, more or less permanent but slighter in its incidence than penal servitude, by which old offenders might be restrained from preying upon the public. The question of the transportation of those criminals whose records show that they systematically live by violating the laws of property is well worth considering. If some such system were introduced into Ceylon, the mere knowledge of the consequence entailed by entering on such a career would, as Sir Robert Anderson points out, be in itself a powerful check on the criminal propensity to crime.

Prevention, it is said, is better than cure, and it has also been added that it is vastly more easy. The majority of this floating body of criminals are incurable; they commit crimes which also are incurable; their removal from society can be the only really effective preventative. Such a removal would confer an incalculable blessing on the country. It would not only enormously diminish crime, but would also save a large number of the younger generation from contamination.

There were no fires of importance during the course of the year. Towards the close of it the fire engine which Major Knollys had been instrumental in inducing the Municipality to obtain arrived from England. As, however, the fire station, which is in course of construction, was not ready to receive it, it has been temporarily stored in the Fort fire station.

During the course of the year an International Conference was held in Europe with the view of framing rules for universal adoption in the several countries represented for checking what has been termed "the white slave trade." The time has certainly come when some form of legislation should be introduced into Ceylon, so that control may be exercised over the entrance and residence of undesirable foreigners. An Act dealing with this question, and one which has had a marked degree of success, is in force in India. For many years in England the Government refrained from legislating on the point. In 1898 a measure was introduced in Parliament and passed both Houses unopposed. On the introduction of this Act, the Vagrancy Act of 1898, the fraternity against whom it was directed disappeared from the streets of London. The main point of the enactment is to raise a legal presumption that a man is knowingly living on the earnings of a woman, and is guilty under the Act, when it has been proved that he is habitually in the company of a woman of a certain class and has no visible means of subsistence. The incorporation of the chief provisions of these Acts in a Ceylon Ordinance is most desirable.

The duties of the Harbour Police have been satisfactorily performed. The old ship has been replaced by the hospital ship, which makes a more comfortable and roomy station.

Great care has been exercised in the training of recruits. Each recruit is put through a course of about five months' training. The first month is devoted to gymnastics, then follows three months' drill intervaried with physical exercises, at the expiration of which there is a course of musketry. This course of physical culture is supplemented by daily oral lectures and catechism on police duties. Before being passed out the recruit has to learn beat and patrol duty by actual experience in Colombo, in addition to having to attend the Police Court to learn the Court procedure.

During the year the police sports were first held. The inauguration was attended with such success that it has been decided to make them an annual event. Major Knollys, who took the greatest interest in them, has presented "The Knollys Shield" for yearly competition. The winner of the greatest number of events at the sports becomes the holder of the shield for the year, and has the privilege of having his name engraved upon it. Special encouragement has been given to gymnastics, and in May a gymnastic competition was held, at which Major Knollys presented the winners with prizes.

A course of musketry for the whole force has been started, and a special form of firing exercise to be used in case of need at riots has been introduced.

During the year the police have assisted and maintained order at the several public functions which have taken place, notably the unveiling of the statue of Queen Victoria and the Coronation celebration.

It is my duty here to chronicle the universal feeling of regret which pervaded the whole force on the retirement of the late Inspector-General Major Knollys.

R. W. BYRDE,
Superintendent of Police, Colombo.

Colombo, March 9, 1903.

APPENDIX.

A 1.—Summary of Cognizable Offences disposed of by Police Courts of the Island during 1902.

N.B.—A. Cases of a civil nature or cases in which the accusation has been made under a misapprehension of law or fact come under this head; also cases in which it has not been established that an offence has been committed. In the latter case this letter is not used unless the facts connected with the commission of the alleged offence have been thoroughly investigated.
B. The case appears to have been designedly false; no offence committed.
C. Offence not within the jurisdiction of the court.
D. Committed to District Court.
E. Committed to Supreme Court.
F. True.—*a* Accused dead or insane.
b Accused absconded and cannot be arrested.
c Compounded under section 355, as amended by Ordinances Nos. 5 of 1886 and 22 of 1890.
d Evidence insufficient to convict any one.
e Offender unknown.
f Convicted, Police Court.
c = Cases.

A 3.—Summary of Cognizable Offences disposed of by District Courts of the Island during 1902.

N.B.—A. Cases of a civil nature or cases in which the accusation has been made under a misapprehension of law or fact come under this head; also cases in which it has not been established that an offence has been committed. In the latter case this letter is not used unless the facts connected with the commission of the alleged offence have been thoroughly investigated.
B. The case appears to have been designedly false; no offence committed.
C. Offence not within the jurisdiction of the court.

F. True.—*a* Accused dead or insane.
b Accused absconded and cannot be arrested.
c Compounded under section 355, as amended by Ordinances 5 of 1886 and 22 of 1890.
d Evidence insufficient to convict any one.
e Offender unknown.
f Convicted.
C = Cases.

A 5.—Summary of Cognizable Offences disposed of by Supreme Courts of the Island during 1902.

N.B.—A. Cases of a civil nature or cases in which the accusation has been made under a misapprehension of law or fact come under this head; also cases in which it has not been established that an offence has been committed. In the latter case this letter is not used unless the facts connected with the commission of the alleged offence have been thoroughly investigated.

B. The case appears to have been designedly false; no offence committed.

C. Offence not within the jurisdiction of the court.

F. True.—*a* Accused dead or insane.
b Accused absconded and cannot be arrested.
c Compounded under section 355, as amended by Ordinances 5 of 1886 and 22 of 1890.
d Evidence insufficient to convict any one.
e Offender unknown.
f Convicted.

c = Cases.

H.—Recruiting at Headquarters.

DURING the year 1902, 138 recruits were enlisted. Of these, 59 were Sinhalese, 42 Tamils, 18 Malays, 3 Moors, 8 Burghers, 6 Bengalees, 1 Eurasian, and 1 Kaffir.

2. Of the number enlisted, 11 were specials over 25 years of age or under 19, 7 were specials under 5 ft. 3 in. in height; of them, 56 were Sinhalese of the Goigama or Vellala caste, 2 Karawa, and 1 Halagama.

3. All the Tamils enlisted were of the Velalla caste.

4. All enlisted produced certificates of good character.

5. Of 138 recruits, 23 per cent. possessed a "good knowledge of English" in speaking; while 21 per cent. possessed "a good knowledge" in writing; while 22 per cent. of the rest were able to speak and write fairly well.

There was great difficulty in obtaining suitable recruits during the year; and the standard of measurement and education was not insisted on.

6. Beside these, there were 10 Europeans (Colombo Division), 1 European and 16 Natives (Harbour Police) enlisted by the Superintendent of Police, Colombo :—

Europeans.

PRISONS.

REPORT OF THE INSPECTOR-GENERAL OF PRISONS FOR 1902.

I WAS appointed Inspector-General of Prisons in succession to Major Knollys on his retirement from the Public Service, and assumed duties on the 18th August, 1902, relieving Major Firminger, who acted while the former was on leave. I was consequently not able to visit any but the few jails in and near headquarters, nor initiate any improvements during the year. My report will therefore be necessarily brief.

The total population of Ceylon has according to the Census of 1901 increased during the last decade by 558,165, so that in the ordinary course there would be a proportionate increase in the figures in the prison returns; but it is satisfactory to find that the number of convicted prisoners, exclusive of Road Ordinance defaulters, admitted to the prisons during the year, viz., 6,369, bears favourable comparison with the admissions during the previous ten years, while it is less than in the previous year by 212.

Of the total admissions of convicted prisoners to prisons, the following figures give those from the Superior Courts for the last ten years :—

1893	655	1898	1,138
1894	859	1899	731
1895	614	1900	939
1896	854	1901	1,114
1897	1,155	1902	879

The number of convictions for murder and manslaughter, for the same period, has been as follows :—

1893	50	1898	58
1894	82	1899	71
1895	75	1900	82
1896	62	1901	101
1897	88	1902	81

The number of men sentenced to death and of those whose capital sentences were carried out are as follows :—

	Sentenced to Death.	Hanged.		Sentenced to Death.	Hanged.
1893	23	12	1898	28	19
1894	43	23	1899	27	21
1895	26	22	1900	51	32
1896	37	25	1901	47	37
1897	40	20	1902	43	30

The fluctuation in the figures is somewhat remarkable and may be due to many causes. The total number of admissions from the Superior Courts during 1902 is however lower than that of the previous year by 235. The convictions for murder and manslaughter are also lower than in the previous year, but above the average. The number sentenced to death, though slightly less than those for the two years 1900 and 1901, is higher than the total of any previous year since 1895, indicating that these crimes are not on the decrease. During the last three years a total of 141 persons were sentenced to receive the extreme penalty of the law, and of these 99 have been executed. It is deplorable to see that hanging has had no deterrent effect in the mind of the would-be murderer. Notwithstanding this severe punishment, cases of murder and manslaughter are apparently on the increase. The Police returns will give details.

Convictions for aggravated assaults are more satisfactory, being 173 in 1902, the lowest during the last seven years; the figures for the last ten years are as follows :—

1893	154	1898	350
1894	207	1899	191
1895	143	1900	205
1896	264	1901	286
1897	303	1902	173

No. 1.—The following table shows the number of convicted prisoners committed to prison from all courts and their daily average :—

	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.

Total of all Jails ...	354	237	179	114	2	1	173	122	8	5	—	20

The admissions of Road Ordinance defaulters are most satisfactory, being the lowest on record: 237 defaulters out of a total of 666,189 (number on the division officers' lists for 1901) tax-paying males between the ages of 18 and 55 must be considered a very satisfactory result, which the authorities concerned may rightly be proud of.

The problem of the Road Ordinance defaulter appears to have been one of much anxiety and difficulty to the Government of the Colony till the passing of the Ordinance now in force. In 1883 as many as 15,283 defaulters were confined in the jails of the Island. From this time there has been a gradual and marked fall in the number sent to jail, until in the year under review the number fell to 237. It must be remembered that of these only 122 were absolute defaulters, and of the latter only 97 actually served their sentence, 5 having been discharged on medical certificate and 20 on pardon in commemoration of the Coronation of Their Majesties the King and Queen. When it is found that there is no way of evading the tax, no one who is really able to pay it will neglect to do so and allow himself to be committed to jail.

The Southern Province is responsible for a higher average of defaulters, but this is not surprising, as it has contributed largely to the criminal population as well.

Table No. 3 gives the number of escapes from the prisons and recaptures during the past ten years, and is as follows:—

Year.	Escapes.	Recaptures.	Year.	Escapes.	Recaptures.
1893	18	18	1898	10	10
1894	5	6	1899	8	8
1895	11	13	1900	1	1
1896	9	8	1901	2	2
1897	13	12	1902	81	75

The total number of escapes for 1902 is 81, the highest on record. Though classified under escapes from prisons, 79 represent escapes from the working party at the Mahara quarry outside the prison, so that only two prisoners really escaped from inside a prison, namely one from Mahara, the other from Avisawella, a not very safe jail.

The facts connected with the escape at Mahara are shortly as follows:—On the 28th June, 1902, at about 2 P.M., the prison guard was surprised by a simultaneous rush of about one hundred prisoners from the working party at the Mahara quarry, armed with crowbars and other implements used in stone-cutting and dressing, and overpowering the officers: 79 of the prisoners made their escape. A deputy jailer was knocked down and deprived of his revolver by one of the ringleaders, while four overseers were beaten, wounded, and disabled by other prisoners. Both the police guard and the prison guard were quite unprepared for such a contingency, the attack being a preconcerted one, and the result was they were terror-stricken and put into consternation and were not able to take prompt action. The men escaping were, however, shot at by some of the guards, who seriously wounded some of them. The firing, however, had the effect of preventing the other prisoners who were working in the quarry, and who no doubt were in the conspiracy, from following their more daring comrades, otherwise it is probable that all would have made their escape.

Immediately on receiving information of the mutiny Mr. Byrde, the Superintendent of Police, proceeded to Mahara with the Superintendent of the Convict Establishment by special train, taking a party of armed police. Mr. Allnutt, Assistant Commandant of the Prisoners of War camp at Ragama, to whom immediate information was sent by the jailer, arrived at once with Major Bishop and a company of soldiers, and rendered every assistance to the prison authorities. One escaped prisoner was shot dead at a village called Surigama, and two of the prisoners wounded have died through the effects of gunshot wounds. About forty were recaptured during the day, and another thirty-two before the end of the year, and one since.

[*For Table No. 4 see next page.*]

Table No. 4 gives the number of convicted prisoners in all prisons on the last day of the year There were eleven prisoners in Avisawella prison, none in the Hambantota and Puttalam prisons, and one in Trincomalee. The largest number was detained in Welikada, and in Mahara, Mutwal, Bogambra, Negombo, and Jaffna prisons also large numbers were detained.

In Avisawella only remand prisoners and prisoners convicted for seven days and under are detained, the others being regularly transferred to Welikada. Now that there is railway communication to this station, it is a matter for consideration whether this jail may not be closed and the cost of keeping it saved. The cost of maintaining a prisoner in this prison during 1902 was nearly Rs. 300.

Hambantota prison was for some time used as a convalescent jail for prisoners suffering from chest diseases till it was required for the prisoners of war. They have since left it. The convalescents have found a suitable home in the Batticaloa prison, which suit them admirably, and I do not see any advantage in transferring them back to Hambantota, which, too, might be closed with advantage, if the Fiscal's Department can undertake the transfer of the few local prisoners to Tangalla. The cost of maintaining a prisoner in Hambantota prison during 1902 was nearly Rs. 1,200.

In Welikada, the largest prison in the Island, there are several trades parties, such as tailors, tinkers, carpenters, masons, &c., besides those employed in jail service and some penal stage prisoners, the latter being employed at husk-beating, pingo-carrying, and in the treadmill. Juveniles are kept in a separate ward. A part of this prison is still used as a military prison for the prisoners of war.

In Mutwal and Mahara the prisoners are employed in connection with the Harbour Works, and they receive full diet.

Bogambra is used as a penal stage prison, but there is a small party of class prisoners working in the recreation grounds. I have introduced a tailors' party, which now make prisoners' clothing for all jails except the Convict Establishment. I expect by next year the making of officers' uniform, which is now done by contract, to be done here by prison labour.

Negombo is a prison for the confinement of convalescent prisoners, who are found light work, such as basket-making, twisting rope, making brooms, &c.

At Jaffna habituals are confined and are employed in pingo-carrying.

Table No. 5 shows the number of committals received from the Supreme and District Courts during the past ten years :—

	1893.	1894.	1895.	1896.	1897.	1898.	1899.	1900.	1901.	1902.
Offences against the person ...	360	455	325	468	614	581	381	485	559	392
Offences against property :—

These returns do not require comment. The prisoners are now well fed, well cared for, and well nursed when sick.

Table A in Appendix IV. gives the daily average of all convicted prisoners in the jails. The figures are 2,404·34, as against 2,447·75 for the previous year. This includes Road Ordinance defaulters and prisoners under sentences of simple imprisonment. It will be seen that there is a satisfactory decrease in the daily average of road defaulters and of females, while that of juveniles has also slightly decreased.

Table B shows how the prisoners were disposed of during 1902. There were in the prisons on 1st January, 1902, 2,540 convicted prisoners, as against 2,323 on the 1st January of the previous year. The number on the list on 1st January, 1903, was 2,371. 148 were discharged on pardon, as against 40 in 1901. The number of deaths was the same. There has been a slight decrease in the number executed.

Table C gives the terms of sentences of prisoners received direct from courts. There has been a marked increase in the number of sentences of two weeks and under, the district of Tangalla contributing an unprecedentedly large proportion of these. Of long sentences there was a marked increase in 1901, but in 1902 it decreased by nearly half. The figures for the last four years are as follows:—

1899	...	...	124	1901	....	...	240
1900	...	...	138	1902	...	...	130

Table D gives practically the history of the Ceylon prisoner as regards his connection with the prisons. Of the total number of prisoners admitted to jails (exclusive of Road Ordinance defaulters), namely, 6,369, as many as 1,218 have been in jail before; of these, 682 have been once before, 240 twice, 114 three times, and 182 more than three times. The identification and registration of prisoners for the purposes of the Habitual Criminals' Ordinance is now satisfactorily and systematically done, and no prisoner who has a previous conviction for a crime as defined by the Ordinance can escape with a light sentence, if the Magistrate gives opportunity for his identification before passing sentence on him.

Table E gives the daily average and number of unconvicted prisoners received direct from courts. There has been a decrease in both.

Table F gives the daily average, admissions, and deaths. Twelve unconvicted prisoners awaiting trial, &c., have died, as against 9 of the previous year. Of the convicted prisoners, 3 out of the 113 who died were escaped convicts from Mahara shot at while escaping. It will be seen that almost all the deaths occurred in the jails of the Convict Establishment and in Bogambra and Negombo prisons, where the majority of the prisoners are confined. Medical supervision in these jails is, I should say, complete; all that is necessary for the comfort of the sick is found. A trained nursing staff has been provided for the Borella Convict Hospital. The reports of the Medical Officers of the Convict Establishment and Bogambra prison will deal with the health of the prisoners in these jails.

Table G gives the escapes and recaptures. I have already dealt with this return.

Table H gives details of punishments inflicted on prisoners. The number reduced to penal stage is much higher than during the previous year, but this is a very ordinary punishment. The number of punishments by prison visitors has increased, due to their having tried the recaptured prisoners who escaped from Mahara. It was necessary that these should be severely dealt with. The cat and the cane are no longer freely used for punishing prisoners for prison offences. The Superintendents of Prisons have recourse to these only when no other suitable punishment is practicable. Corporal punishments for prison offences when imposed by Superintendents are not now carried into effect, except in exceptional cases, without reference to Government.

Table I shows the number and nature of punishments awarded to prison officers. This return, I regret to say, is most unsatisfactory. The number of punishments has greatly increased under all heads, being 1,767 in 1902, as against 1,255 in 1901. I find that my predecessors have dealt with this matter very fully in previous reports. I do not intend to discuss the question now, but would remark that a prison officer who is required to devote nearly twelve hours of his time daily to a difficult, responsible, and trying work deserves to be more liberally paid than they are at present.

Table K shows the number of prisoners treated in the various jail hospitals. I note that the percentage of sick to strength in Welikada prison was high. This, I believe, is due to two causes: (*a*) To the transfer of serious cases in Mahara and Hulftsdorp prisons to the Borella Convict Hospital for better treatment. Such cases are included in the Welikada strength; (*b*) Weak and delicate prisoners who are more apt to get sick are also kept in Welikada.

Table L shows the religions of all prisoners convicted and unconvicted.

Table M shows the nationalities of all prisoners. It is noteworthy that not a single resident European was convicted during the year.

Table N gives the ages of all prisoners admitted direct from courts. There is very satisfactory decrease in the number of juveniles being 27 in 1902, as against 45 in 1901. The number of prisoners under the age of 20, which rose to 981 in 1901, has gone down to 818, while the number under 30 has also decreased. In 1902 it was 3,402, in 1901 3,618. It is hoped that with the advance of education this feature will be maintained in the future.

Tables O, P, and Q give particulars of the crimes for which prisoners were convicted by the Supreme, District, and Police Courts respectively.

Table R gives particulars of expenditure.

Table S shows the labour on which the prisoners were employed.

The last table I attach is interesting as showing the effects of education on crime. This return refers to Welikada jail only.

Mr. D. Duggan, a first class European jailer of some years' standing, and who acted as Assistant Superintendent of the Kandy prisons, and later as Acting Assista nt Superintendent of the Convict Establishment, retired from the Service and left for England early in the year. Mr. H. B. Oldham, after a training in the convict prisons in England, was appointed Second Assistant Superintendent of the Convict Establishment, and assumed duties in September last year. He is now doing duty as Acting Assistant Superintendent in the place of Mr. Lloyd, who went on leave in October last.

I attach report from the Superintendent of the Convict Establishment as also those of the Medical Officers of the Convict Establishment and Kandy prisons.

Prisons Office,
Colombo, March 25, 1903.

A. W. DE WILTON, MAJOR,
Inspector-General of Prisons.

APPENDIX I.

REPORT OF THE SUPERINTENDENT OF THE CONVICT ESTABLISHMENT FOR 1902.

THE daily average of convicted prisoners for 1902 was 1,571, showing a decrease as compared with the previous year of 29.

The expenditure of 1902 was Rs. 293,482, or an increase of Rs. 39,818 over the previous year, but these figures are really fallacious, as part of the cost of 1901—*i.e.*, the expenditure for November and December of that year—was paid out of the votes for 1902.

The value of prisoners' labour was Rs. 151,022, as against Rs. 139,864 of the previous year.

Welikada.—The part of Welikada proclaimed as a military prison is still in the hands of His Excellency the Governor for military purposes, and is used for the confinement of Boer prisoners of war. The drainage scheme has been completed as far as the inside of the jail is concerned, the drains outside forming part of the scheme are in hand.

Mutwal.—The daily average of prisoners in this jail, which was 444·43 in 1901, fell to 320·66 in 1902, but even this number is in excess of the requirements of the Harbour Engineer. The question will shortly arise as to how the number in excess of this officer's requirements is to be employed.

Mahara.—The daily average of prisoners in this jail was 583·32 in 1902, as against 428·66 in 1901. The reduction from its authorized strength of 617 is accounted for by the escape of 79 prisoners on the 28th June. With the exception of the two months following this escape, the jail was kept up to its full strength.

Escapes.—With the exception of the 79 escapes already referred to, only one escape took place in the year 1902 from the jails of the Convict Establishment. The offender was immediately recaptured.

Health.—The health of the Convict Establishment, judged by the death-rate, showed a considerable improvement over the year 1901, there being only 72 deaths, against 80 in the latter year. The cases treated in hospital have slightly increased, but I have frequently pointed out that this can scarcely be considered a criterion of the real health of the prisoners. An epidemic of mumps or measles or some trifling disease will cause a large increase of the sick-rate without affecting the death-rate or the real health of the prisoners.

Discipline.—I regret that the returns of punishments in the Convict Establishment for the year 1902 are unsatisfactory. The punishments of officers increased from 937 in 1901 to 1,396 in 1902. The punishments of prisoners, not including those implicated for the outbreak at Mahara, increased from 2,424 to 3,050, but the importance of these figures will be further exemplified by dividing the year into two parts—*i.e.*, from January to June and July to December. For the first six months reports against officers were 555, or slightly less than for the same period of 1901; for the second half-year they were 844. The punishments of prisoners for the first six months of the year were 1,143; for the second half-year, 1,907. I propose further dealing with this under the head "General."

General.—On the 28th May I returned from fourteen months' leave in England and relieved Mr. Lloyd, who was acting as Superintendent of the Convict Establishment. I also assumed the duties of the Inspector-General of Prisons in addition to my own.

I found the general discipline and management of the Convict Establishment had deteriorated during my absence. There was a general slackness among the officers, which the prisoners took advantage of. I attribute this to the inadequacy of the European staff. Mr. Phillips, the only European jailer who is competent to undertake the management of the Welikada prison, had been acting the whole time as Assistant Superintendent, Kandy. Mr. Duggan, the Acting Assistant Superintendent of the Convict Establishment, was in a state of health that prevented him from fulfilling the important duties he was entrusted with, and therefore the whole work in reality devolved upon a single officer, viz., Mr. Lloyd, and the strain proved so great that for the first time in twenty-four years' service he fell sick.

I cannot adduce a better example to show how discipline had been relaxed than to quote the numbers of reports against officers and prisoners for the six months before and after my return :—

	First Six Months.	Second Six Months.
Officers	555 ...	844
Prisoners	1,143 ...	1,907

or an increase of 52 per cent. in officers' reports and 67 per cent. in those against prisoners.

On the 28th June, a month after my return, the most serious outbreak that has ever taken place in the prisons in the Island occurred at Mahara, a full report of which, together with my opinion of the circumstances which rendered it practicable, was sent to Government.

It has been decided by Government that from 1st January, 1903, the officers of Mahara jail, with the exception of the jailer and deputy jailer, should consist entirely of Malays at a considerable increase of pay.

On the 17th August I handed over the duties of the Inspector-General to Major De Wilton, who had been appointed Inspector-General of Police and Prisons.

I regret to say that the class of candidates applying for posts of guards and sub-overseers is even worse than when I reported in 1901. There are at present twelve vacancies in the Convict Establishment, and not a single eligible candidate. I have reason to believe that this state of affairs will become worse as the prosperity of the Island and the demand for intelligent men of good character increase. Five guards were convicted before the Police Court for trafficking with prisoners, and the fact that no fewer than 1,404 punishments were inflicted on the officers of the Convict Establishment in the year under review proves beyond contention the impossibility of maintaining satisfactory discipline among prisoners in their charge.

In forwarding the Medical Officer's report, I notice that he makes the periodical recommendation for the increase of the penal diet. I have fully reported to Government on this matter.

R. E. FIRMINGER,
Superintendent.

APPENDIX II.

REPORT OF THE MEDICAL OFFICER OF THE CONVICT ESTABLISHMENT FOR 1902.

I HAD medical charge of the Convict Establishment during the whole year.

Strength and Accommodation.—The daily average strength of the prisoners in all the jails of the Convict Establishment during the year was 1,665·87, being a decrease of 48·63 from that for 1901, when it was 1,712·50. At Welikada the average during the year was 671·46 against 728·53 in 1901; at Mutwal 320·66, against 444·43; and at Mahara 538·30, against 426·88, or a decrease in the average strength in Welikada and Mutwal of 57·07 and 123·77 respectively, and an increase in Mahara of 156·42. There was no overcrowding either at Mutwal or Mahara, but there was overcrowding in the Welikada prison for short periods on a few occasions.

Food.—The provisioning of the jails and hospitals of the Convict Establishment is in the hands of a contractor, who has on the whole carried out his work in a satisfactory manner. In my report for last year I pointed out that the light labour and penal No. 1 diets appeared to me to stand in need of some improvement. About the end of the year under review there was some correspondence on the subject of the latter (penal No. 1 diet) in connection with the prevalence of bowel complaints in the prisons; but owing to the want of accurate statistics regarding the number of prisoners placed on this diet and rate of sickness and mortality among them, no definite conclusion could have been arrived at as to the effect of this diet on the health of the prisoners receiving it. I have therefore asked that accurate statistics be kept in all prisons with a view to obtaining particulars above indicated, and I believe the Inspector-General of Prisons has issued instructions to the Superintendents of all jails to that effect.

Water Supply and Labour.—These subjects have been fully dealt with in previous reports, and there is nothing new or important to refer to in this report.

Hospitals.—The total number of patients treated in all the hospitals of the Convict Establishment during 1902 was 3,907, as against 3,508 in 1901, the figures for the various hospitals being as follows for each of the two years:—

	1902.	1901.
Borella Convict Hospital	2,209	2,224
Mahara Convict Hospital	1,617	1,175
Welikada Female Hospital	79	106
Mutwal Hospital	2	2
Hulftsdorp Hospital	—	1
	3,907	3,508

On comparing the figures for the two years it will be seen that there was a decrease this year in the number treated in the Borella Convict and Welikada female hospitals of 15 and 27 respectively, while there was an increase of 442 in the number treated at the Mahara hospital. At Mutwal the number treated was the same for the two years, while there was none treated at Hulftsdorp during the year.

Of the total number of patients admitted for treatment to the Borella Convict Hospital, 1,199 were received from Welikada, as against 1,296 in 1901; 380 from Mutwal, as against 740 in 1901; and 437 from Mahara, as against 52 in 1901; while the number from Hulftsdorp was 68, being the same as that for last year.

The total number of deaths in all hospitals was 72 as against 80 for the previous year; 48 deaths occurred in the Borella Convict Hospital, as against 66 in the previous year, or a decrease this year of 18 deaths. There were 22 deaths at Mahara, as compared with 12 during the previous year, or an increase of 10 deaths, which was chiefly due to the occurrence of a virulent type of pneumonia, from which 15 deaths occurred out of 24 cases treated, the remaining being due to other causes.

The number of cases of infectious diseases consisting of chickenpox and mumps treated in the infectious wards of the Borella Convict and Mahara jail hospitals was 262. Of these, 244 were cases of chickenpox and 18 of mumps. 155 of the former were treated at Mahara and 89 at the Borella Convict Hospital. It should, however, be mentioned here that 89 cases treated in the Borella Convict Hospital were cases which occurred at Mahara, and had been transferred to this hospital in a convalescent state, so that the actual number of cases of chickenpox which occurred in the jails of the Convict Establishment during the year under review was 155; but even this number is a considerable increase of that for the previous year during which only 23 cases were treated. Of diseases of the eye, 127 cases were treated in the Borella Convict Hospital and 107 at Mahara, making up a total treated of 234 cases as compared with 239 treated during the previous year.

Four prisoners, three males and one female, sent from the Welikada prison to the General Hospital for treatment died in that hospital, and doubtless these deaths will be included in the returns of that hospital; I have therefore excluded them from my returns.

Thirteen prisoners were executed within the Welikada jail during the year, and the executions were carried out in a satisfactory manner.

I append the usual tables.

A.—Table showing the Strength, Rate of Sickness, and Mortality for the Years 1900, 1901, and 1902.

	1900.	1901.	1902.

ALFRED B. SANTIAGO, F.R.C.S.,
Assistant Colonial Surgeon.

APPENDIX III.

REPORT OF THE MEDICAL OFFICER OF THE KANDY JAILS FOR 1902.

I ASSUMED charge of the Kandy jails from 12th December of last year only, and am not therefore in a position to submit a full report.

Jail Strength and Accommodation.—The admissions into the Bogambra jail during the year were 2,165, and the average daily strength 412·12; while those of the Old Jail were 1,144 and 59·96 respectively. There was no overcrowding for the year, and the accommodation offered by both jails is sufficient to prevent any such occurrence.

Diseases and General Health of Prisoners.—Malarial fevers, intestinal diseases, respiratory affections, and eye diseases contributed towards the largest admissions into hospital. In addition 52 cases of mumps and 15 of chickenpox were transferred to the infectious diseases hospital for treatment. With reference to these infectious cases, the first case of mumps was discovered on the 4th July, and the disease continued unchecked up to the end of the year. One case was received, I understand, from Colombo, and another was discovered in a prisoner who was received locally over night, and ever since the disease has continued with short intermissions.

The following comparative table shows the cases treated, &c., during the last two years :—

	1901.	1902.
Remained on 31st December of year previous	12	14
Admitted	622	793
Total treated	634	807
Discharged	606	756
Died	14	27
Remaining at the end of year	14	24
Daily average of sick	15·58	20·83
Percentage of deaths to total treated	2·20	3·34
Percentage of sick to strength	14·07	24·38
Percentage of deaths to strength	·31	·81

It is manifest from the above that there was an apparent increase in the sick for the year, and this is readily attributable to the increased number of infectious cases that occurred during the year; otherwise the general health would bear very favourable comparison with that of the preceding year.

The deaths were due to debility 2, meningitis 1, enteric fever 1, pneumonia 5, dysentery 9, phthisis 1, tuberculosis 1, malarial fever 1, diarrhœa 6, total 27.

Eight prisoners were transferred to a convalescent jail; 98 were put to light labour for disease, age, and deformity. There were six executions for the year.

As far as I can gather, the past year was a fairly healthy and satisfactory one. The great evil the Medical Officer has to contend with is the general occurrence of intestinal diseases, which contribute most largely towards the death-rate. I am inclined to believe that the change of diet in the penal stage of men is largely responsible for this, as those unaccustomed to the daily consumption of bread, suffer most from these diseases, and often complain of its being a fruitful source of their condition.

Labour.—The prisoners located here are penal stage and class men. The latter, few in number, belong to the jail service, so that this is practically a penal jail with hard labour of pingo and husk-beating. To the latter are relegated those unfit to perform the former.

Food and Diets.—Raw provisions are supplied by a contractor and are cooked in the jail by prisoners. The supplies are examined daily, and if inferior in quality or otherwise unfit are rejected. During the year the contractor was fined more than once for supplying inferior quality of provisions.

Water Supply.—Both jails have an abundant supply of wholesome water. It is derived from the town supply, and is boiled previous to use. Bathing arrangements are satisfactory. The dead-house requires a pipe laid on, as it has no water supply.

Latrine and Night Soil.—The latrines are worked on the dry-earth system, and the removal of the buckets and their contents is attended to by the Municipal carts.

Jail Hospital,
Kandy, January 20, 1903.

H. HUYBERTSZ,
Deputy Assistant Colonial Surgeon.

PART IV.—MISCELLANEOUS.

MEDICAL.

REPORT OF THE PRINCIPAL CIVIL MEDICAL OFFICER AND INSPECTOR-GENERAL OF HOSPITALS FOR 1902.

I HAVE the honour to submit for the information of Government the Administration Report of the Medical Department for the year 1902, with the usual statistical tables.

I was granted nine months' leave from the 13th April, 1902. Dr. C. T. Griffin, the Assistant Principal Civil Medical Officer and Inspector-General of Hospitals, acted for me, and Dr. Ebell, Colonial Surgeon, acted for Dr. Griffin during this period.

I.—POPULATION: BIRTH- AND DEATH-RATES.

The estimated population of the Island on 31st December, 1902, was 3,685,267 (inclusive of the military and shipping population and the prisoners of war). 141,893 births were registered and 99,680 deaths. The birth-rate was 39·0 against 37·5, and the death-rate 27·4 against 27·6 per mille in the previous year, calculated on the estimated population in the middle of the year.

II.—PUBLIC HEALTH.

The public health during the past year has been on the whole good. There have been no widespread severe outbreaks of malaria; there have been a few outbreaks of cholera and smallpox, but these have been very moderate in severity and extent.

Malaria.—In the Western, Central, and North-Central Provinces malarial fevers were very slight. In the Northern Province the cases were more numerous than in the previous year, and the character of the fever was quotidian and tertian. This disease was most prevalent in the North-Western, Sabaragamuwa, and Eastern Provinces.

The relationship between malarial fevers and rainfall will be found in the accompanying charts, which have been prepared by A. J. Chalmers, M.D., F.R.C.S.

The people of the Island are becoming acquainted with the fact that malaria and mosquitoes are intimately associated, and they are being instructed as to the prevention of the disease by improved sanitation, &c.

Malaria in Colombo.—An attempt has been made during the year to find out where people primarily become infected with malaria in Colombo. There must be a number of errors in this attempt, but time will show these if the same plan adopted this year is carried out in following years. Primary malarial infection is prevalent in the wards in the following order :—

(1) Pettah (with St. Paul's and St. Sebastian's).
(2) New Bazaar.

Then a long drop in the numbers takes place, and then come—

(3) Slave Island.
(4) Kotahena.
(5) Maradana.

Primary malaria is insignificant in—

(6) Kollupitiya.
(7) Fort.

Cholera.—There were 179 cases of cholera, with 116 deaths, during 1902; outbreaks occurred in the Western, Central, Northern, Southern, Uva, and North-Western Provinces. The greatest number occurred in the Western Province, which includes the Cooly Camp at Ragama. There were 74 cases, with 55 deaths, in this Province; 36 cases and 28 deaths in the Northern Province. The North-Western Province had 29 cases and 16 deaths; the Central Province 22 cases, with 12 deaths; the Southern Province 21 cases, with 4 deaths; and in the Province of Uva there were 2 cases, with 1 death.

The establishment of the Ragama Camp for coolies has been of great benefit towards reducing the outbreaks of cholera and other infectious diseases in various parts of the Island. In nearly every outbreak of cholera during the year infection could be traced to India.

The subjoined table shows the Provinces in which outbreaks occurred, the number of cases attacked, the number of those who died, with their nationality :—

Province.	No. of Cases and Deaths.		Nationality.													
			Sinhalese.		Moors.		Tamils.		Malays.		Immigrants.		Other.		Total.

Smallpox.—There were 146 cases of this disease, with 35 deaths; they occurred in the Western, Southern, North-Western, and Northern Provinces. In the Western Province 2 cases were remaining at the end of the year 1901 in the Infectious Diseases Hospital, Kanatta, and 118 cases were admitted in 1902, making a total of 120 cases, with 32 deaths. Two of these were cases from ships. The other cases were from Negombo and Moratuwa. In the Southern Province there were 19 cases, with 3 deaths; in the North-Western Province 3 cases; and in the Northern Province 2 cases. The Central, North-Central, Eastern, Uva, and Sabaragamuwa Provinces were free from smallpox during the year.

Chickenpox.—There were 2,293 cases of this disease, with 3 deaths, reported from various parts of the Island, distributed as follows :—

	Cases.	Deaths.		Cases.	Deaths.
Western Province ...	1,057	3	Southern Province ...	222	—
Province of Sabaragamuwa ...	238	—	North-Western Province ...	21	—
Province of Uva ...	73	—	Northern Province ...	13	—
Eastern Province ...	17	—			
North-Central Province ...	3	—	Total ...	2,293	3
Central Province ...	649	—			

Most of these cases were treated in their own homes, but in towns where an infectious diseases hospital exists many of the cases were moved there.

Measles.—This disease did not assume any alarming proportions in any of the towns or villages.

Dysentery.—This disease was fairly equally distributed throughout the Island. In the Central, Western, and Sabaragamuwa Provinces it was most prevalent. In the Northern Province the numbers attacked were slightly in excess of the previous year. In the Eastern Province the prevalence was not marked, but it was present throughout the year. In the Province of Uva the cases were comparatively few. The total number of cases treated in all hospitals was 3,017, with 999 deaths. The largest number treated in any one institution was at the General Hospital, Colombo, where 488 cases were admitted, of whom 89 died.

Enteric Fever.—The number of cases treated in the various hospitals throughout the Island was 242, with 63 deaths. The General Hospital, Colombo, admitted 133 cases, of whom 32 died. Some improvement has been made in the number of cases notified. This remark applies especially to Colombo, owing to the attention of the public having been drawn to the law by advertisement in the *Gazette* and local Press; still I have no doubt very many cases occurred, of the existence of which the authorities had no knowledge.

Causation of Enteric Fever.—Many of the cases are landed from the port. Pollution of water and milk are the commonest causes of this disease here. The cesspit system, which exists in some of the large towns, notably Colombo, Kandy, and Galle, has much influence on increasing the number of cases.

Leprosy.—The total number of cases reported during the year 1902 was 560, against 590 in the previous year, being a decrease of 30 cases.

Return of Lepers treated as Outdoor Patients in the Hospitals and Dispensaries during the Years 1901 and 1902.

	1901.	1902.		1901.	1902.
Western Province ...	48	32	North-Central Province ...	—	—
Central Province ...	6	28	Province of Uva ...	7	4
Northern Province ...	6	9	Province of Sabaragamuwa	10	40
Southern Province ...	19	29			
Eastern Province ...	37	6	Total ...	135	148
North-Western Province ...	2	—			

382 cases were treated in the Leper Asylum, Hendala, and 30 in the Kalmunai wards. The new cases came from the following places :—

	New Cases.		New Cases.
Western Province	37	Province of Sabaragamuwa ...	3
Central Province	2	Mauritius	1
Southern Province	8		
Southern India	6	Total ...	59
Province of Uva	2		

The Western Province, which includes the Colombo District, shows the largest number of cases, but this may be due to the proximity of the Asylum for the residents.

The Leper Ordinance came into operation at the beginning of this year, and 113 cases have been reported. Many of them have been accommodated in the Hendala Asylum; a few have been isolated in their own homes, where the conditions existed which allowed this. Dr. Meier, the Superintendent at Hendala, in his report remarks on the smaller number of admissions to the Asylum this year as compared with previous years, and he considers this is due to the Ordinance. In former years patients voluntarily sought admission, whereas now they avoid, if possible, being sent; they prefer their liberty to a lifelong residence in the Asylum.

Dr. Van Houten of the Dutch Ambulance, a prisoner of war, worked on the subject of leprosy during the year, and published some valuable scientific results. He isolated a bacillus which he cultivated outside the human body.

Anchylostomiasis.—This disease is constantly being introduced from India by Malabar coolies, and is spread broadcast owing to the careless habits of the cooly, who pollutes the soil and water with his excreta. This disease is on the increase. There were 1,609 admissions in all hospitals, with 257 deaths. The largest number was treated in the Colombo Hospital, viz., 702 admissions, with 47 deaths. A large number of cases occurs in the planting districts. The danger of the disease exists in the profound anæmia, which so lowers the vitality that the victim is carried off by practically any intercurrent complaint. I am inclined to regard a part at least of the increase in the reported cases of anchylostomiasis to the fact that the disease is recognized now, while only a few years ago it would probably have been regarded as anæmia consequent on malarial fever.

Parangi.—From the hospital returns it would appear that the number of admissions for this disease has steadily increased during the last five years, but not in proportion to the increase of the population, so that the number affected in ratio to the inhabitants is becoming less every year. As food becomes more easily obtainable with the extension of irrigation, and as sanitary methods become more generally known, this disease will show a marked decrease. The death-rate is remarkably small: out of 3,434 admissions for this disease during the year there were only 10 deaths.

I attach herewith a return of the principal diseases for the last five years for purposes of comparison :—

Comparative Statement of Principal Diseases for the last Five Years.

NOTE.—Cases of these diseases at Boer Camps not included.

METEOROLOGICAL CONDITIONS AND THEIR RELATIONSHIP TO MALARIA.

This is the third year during which a series of charts has been prepared to illustrate the relationship between malaria and the rainfall. The report for 1900 contains curves which, though illustrating the general truth of the relationship, yet could hardly be considered as very satisfactory, owing to the small number of figures available for the curves. The report for 1901, however, contains curves which were considered to be approximately accurate.

The Island has again been roughly divided into eastern and western portions, affected by the north-east and south-west monsoons respectively. The charts show the curves of the numbers of total diseases and malaria and the average rainfall. The subject may be considered under two heads—

(*a*) The malaria in the west.
(*b*) The malaria in the east.

(*a*) *The Malaria in the West.*—Chart I. shows the curve of total diseases in the western portion of Ceylon. It will be noticed that there are two maxima, one in January and the other in May; and two minima, one in February and the other in October and November. In most details this curve corresponds with last year, with the exception that the one which should begin in October is deferred till December.

Chart II. shows the curve of malaria in the west. Its maximum is in January, and after a slight rise in April it falls to a minimum in October and November. Comparing this with last year a general similarity can be noted, but the minimum is deferred from September to October, and the rise only begins in December instead of in October.

Chart III. shows the total rainfall from a number of stations in the west, represented as the mean rainfall and not in the aggregate.

The average rainfall is considerably greater than last year, and the great maximum is in October instead of November, though the rainfall in November and even in December is much more than last year's: *e.g.*, in November, 1901, the rainfall was over 11, while in 1902 it is over 40; in December, 1901, it was over 6·6, while in 1902 it is over 20.

The reason of the usual rise of the malarial curve directly after the rain is probably due to the old cases of malaria getting fever from the chills; and the great rise in January, about four to eight weeks after the usual rise of the rainfall in November, is due to the fact that the land after the rain is covered with water; therefore the mosquitoes abound and multiply, and finding the parasite in numbers in the old cases, spread malaria rapidly.

This theory to explain the usual curve holds good for the unusual curve this year. While the rain is prevailing in October, November, and December there is but little chance for mosquitoes to travel and infect people; consequently the usual rise in December is not seen, and the increase, which is slight, is probably due to old cases. But owing to the wet there is more malaria than in previous years—*e.g.*, October, 1901, from 7,000 to 8,000 cases, in November 8,000 to 9,000, in December 12,000 to 13,000, while in 1902 the figures are 11,000 to 12,000, 11,000 to 12,000, 12,000 to 13,000, respectively—so that the amount in December of the two years is about the same, while that of October and November is much above the average; hence the rise is not observed, though the number of cases of malaria in December is as great.

The Malaria in the East.—Chart IV. shows the curve of total cases of disease, Chart V. the malaria, and Chart VI. the rainfall. If these are compared with previous years, it will at once be seen that they closely coincide. The rainfall curve does not show the rise in April which it did in 1901. The explanation given above explains these curves. There does not appear to have been heavy rain in October and December, as seen in the west.

General Remarks.—It will thus be seen that the rainfall, influencing the development of the mosquito, produces an enormous effect on the health of Ceylon. Further, that malaria is by far the most important disease of Ceylon, and that this is more so in the east than in the west. The similarity of the curves of the total disease and that of malaria is in general well marked; the other rises in the general curve being due most probably to dysentery and diarrhœa, though this requires further investigation. The most unhealthy month in Ceylon is January.

GENERAL SANITARY CONDITION OF THE COLONY AND OF THE CHIEF TOWNS.

The general sanitary condition of the Island remains in much the same condition as last year. The same methods of disposal of dust and fœcal matter exist, and, though by no means satisfactory, are still far from bad when compared with other tropical countries. The water supply is often very good, and steps are being taken every year to remedy defects.

Colombo.—The town is growing rapidly, and urgent methods are needed and are being taken to keep it in as sanitary a condition as possible.

Port sanitation is the first consideration, as the number of ships entering the port from all parts of the world is rapidly increasing, and the first line of defence to the town against disease is the sanitation of the port. This has been carried out in a most efficient manner during the year. In the town itself the streets have been made wider, so that air space is abundant, but the dust is objectionable and detrimental to health. The streets should, if possible, be watered more frequently to allay this nuisance. The houses of the poor still need much improvement, and attempts to make these more healthy and sanitary are making their mark. The scavenging is fairly good.

The fœcal matter is still removed at night and buried. It need hardly be said that this is objectionable, and that some other method is desirable. Much has been done, but much remains to be done, with regard to the drainage of Colombo. Everywhere collections of stagnant water are to be seen. The smaller system of drainage, as proposed by Mr. Mansergh, C.M.G., is on the point of being carried out.

The water supply from Labugama is deficient in quantity; this defect will be remedied when the new reservoir in the northern part of the town is completed and the main duplicated from Labugama to Colombo. The analysis of the water shows it to be always of very good quality.

Infectious cases, viz., smallpox and enteric fever, have been common.

Kandy, the capital of the Central Province, possesses a Municipality, and employs a medical man as Sanitary Officer. The drainage of the town is defective, but measures are under consideration for an improved system. The water supply is of good quality, but during a long drought is a source of some anxiety. The town itself is well scavenged, and is lighted by electricity. The burial of night soil is the method adopted for the conservancy of the town.

Jaffna, the chief town of the Northern Province, possesses neither a Municipality nor a Local Board. Certain parts of the town are in a very crowded and an insanitary state. There are two public latrines, which are not resorted to. The cesspit system is in vogue. The water supply is from uncovered wells. A new scheme for the water supply of the town is under consideration. Sunlight and free circulation of air are interfered with by the houses being huddled together and by high cadjan fences. The foreshore and other places are fouled and polluted. Drainage requires attention.

Galle, the capital of the Southern Province, possesses a Municipality. Although a good many improvements have been effected as regards the drainage and conservancy, much yet remains to be done. The water supply is still derived from the Bikke reservoir; a system of filtration has not yet been arranged owing to the cost. The dry-earth system has been introduced in some parts of the town, and has been found to work satisfactorily. Although a good deal has been done as regards the drains in the Fort, they are still very defective in several localities.

Batticaloa, the chief town of the Eastern Province, possesses a Local Board, and the sanitary condition is said to be fairly satisfactory. The drainage is very bad, and the water supply equally

so ; the small supply of good water from wells is curtailed by the wells running dry during drought. The latrine arrangements are very defective ; cesspits are used. As in Jaffna, the foreshore and neighbouring jungles are polluted by human excreta.

Kurunegala, the chief town of the North-Western Province, is in a bad sanitary condition ; its drainage and water supply are defective. A new water supply scheme has been reported on, including designs and estimates, and is now under consideration.

Anuradhapura, the principal town of the North-Central Province, formerly had a reputation for unhealthiness, but of recent years, owing to improved sanitary measures, the health of the inhabitants has wonderfully improved.

Badulla, the chief town of the Province of Uva, is in a fairly sanitary condition, and is provided with a good water service. The town is well kept. The drainage, however, is defective.

Ratnapura, the chief town of the Province of Sabaragamuwa, possesses a Local Board, and is in a fair state of sanitation. The water supply is good.

Vaccination.—During the year 149,901 subjects were vaccinated ; 142,141 were primary vaccinations and 7,760 re-vaccinations. Of the former, 121,273 were successful and 9,382 unsuccessful, and in 11,486 subjects the result of the operation was not known, as they failed to present themselves for examination on the appointed days. The percentage of successful cases to total inspected was 92·81. Of the re-vaccinations, 4,652 were successful and 1,500 unsuccessful, and the result was not known in 1,608 cases, as the subjects failed to present themselves for inspection. The percentage of successful cases to total inspected was 75·61. Five calf institutions were in operation during the year at Colombo, Kandy, Galle, Jaffna, and Batticaloa for the preparation of glycerinated calf lymph, which was distributed in sufficient quantities to all parts of the Island. The inhabitants of the Island are well protected against smallpox, and to this cause is due the prevention of the spread of this disease from the various foci that existed during the year. A vote for a new central vaccine station in Colombo has been sanctioned, and it is hoped will be in working order by the middle of 1903.

The following tables give figures for 1901 and 1902 for comparison :—

Table showing the Primary and Re-vaccination in the Island during 1901 and 1902.

Plague.—The Plague Committee is a Standing Committee consisting of the following members:—The Hon. the Principal Collector of Customs (Chairman); K. W. B. Macleod, Esq. (Secretary); the Hon. Mr. F. R. Ellis, C.M.G.; the Hon. the Government Agent, Western Province; the Principal Civil Medical Officer; and the Mayor of Colombo. It has held regular meetings, and has revised from time to time the precautions instituted to combat an outbreak of this disease. This Committee is in reality a Port Sanitary Board, and any subject affecting quarantine and infectious disease arriving in Colombo is dealt with by it. All returns of plague from infected ports are received by the Committee, and telegraphic accounts of plague occurring in places adjacent to Ceylon are received regularly. The staff of Port Surgeons performed their duties with intelligence and promptitude, and were ever on the alert to discover disease among the arrivals at this port. Notwithstanding the strict supervision maintained, the travelling public from infected ports have not been inconvenienced, and no harsh or exasperating rules have been promulgated to interfere with their comfort or to prevent their landing. The disinfection of their baggage and of soiled linen has been well carried out by means of two Thresh's steam disinfectors. The shore disinfecting station has been most useful.

Galle continued to be the plague port; only one case of this disease was reported from the Harbour of Colombo during the year. The patient contracted the disease at Hongkong and was landed and isolated at Galle, and the contacts for this port were placed in quarantine. The patient recovered.

Rat destruction was carried out at the Customs premises and by the Municipality of Colombo and at Galle. A Clayton fire extinguisher for the disinfection of ships' holds by means of sulphurous acid gas arrived, but was not in working order.

All minor ports, with the exception of Kayts in the North, likely to be visited by native trading vessels from India, have been closed, and this arrangement has worked most satisfactorily. As a precautionary measure steam patrol boats have been employed round the coast.

The immigrant cooly traffic has not been interfered with, and several batches arriving from plague-infected parts of India have undergone the necessary period of quarantine at Ragama Camp, when, after proper disinfection of themselves and belongings, they have been drafted to their several estates.

III.—GENERAL.

MEDICO-LEGAL DUTIES.

During the year 1902, 230 analyses were conducted, of which 106 were judicial analyses, 33 were samples of kerosine oil, 8 were samples of fuel oil, 4 were samples of beer, and 26 were samples of water, spirits, &c., from His Majesty's Customs, Local Boards, and the Railway Department, and 53 were samples of water conducted at the request of the Government.

Of the 106 judicial analyses, 64 were undertaken for the detection of poisons and 42 for examination of stains. In the poisoning cases arsenic was detected in 8 analyses, mercury in 2, canabis indica in 10, morphia in 2, strychnine in 2, silver nitrate in 1, lead in 1, zinc sulphate in 2, acid sulphuric in 1, soda sulphate in 2, croton oil in 1, turpentine in 1, sandalwood oil in 2, and in the rest of the analyses no poison was detected.

A synopsis of the analyses for the year in a tabular form is herewith annexed:—

ADMINISTRATIVE: HOSPITALS AND ASYLUMS.

During the year 1902, 67 hospitals and asylums were in operation, against 66 the previous year. A district hospital at Maturata was opened during the year.

Numbers treated.—In the Civil and Lying-in Home Hospitals there were 43,973 cases treated, with 3,698 deaths, being 24 cases more and 521 deaths less than in the preceding year. The daily average sick was 1,652·51, as against 1,647·40 the previous year.

In the Field Hospitals there were 4,426 cases treated, with 171 deaths, against 4,680 treated and 156 deaths during the preceding year. The daily average sick was 179·46, as against 184·29 during the previous year.

The number treated in the five Immigrant Hospitals was 1,855, against 2,047 in the previous year. Of the total treated, the deaths numbered 84, or 6 less than the preceding year. The daily average sick was 73·49, as against 84·45 the previous year.

In the District Hospitals 14,928 cases were treated, against 14,816 during the preceding year. There were 2,510 deaths, as against 3,511 in the previous year. The daily average was 792·41, against 844·27 the previous year.

General Hospital, Colombo.—The total number of patients treated at this institution during the year was 16,035 with 1,101 deaths, against 15,614 cases and 1,219 deaths in the previous year. Of the total treated, 412 remained from the previous year and 15,623 were new admissions, 14,479 were discharged, and there remained 455 under treatment at the end of the year. The daily average sick was 515·09, and the percentage of deaths to total treated was 6·86. The institution consists of twenty-four wards and eight solitary rooms, and the number of beds assigned is 425. Two new temporary wards containing room for 84 beds were opened during the year. The water supply is drawn from the Labugama reservoir, which supplies the town. The supply is sufficient, and the quality good. The latrines are on the dry-earth system.

Paying Wards, General Hospital, Colombo.—These wards consist of Planters' (4 wards with 4 beds), Anthonisz' (2 wards with 2 beds), Passengers' (8 wards with 8 beds), Seamen's (3 wards with 26 beds), Clerical (1 ward with 2 beds), and Cargills' (2 wards with 2 beds). The total number of patients treated in these wards during the year 1902 was 577 with 41 deaths, against 639 cases and 48 deaths in 1901. Of the total treated, 24 remained from the previous year and 553 were new admissions, 520 were discharged, and there remained 16 under treatment at the end of the year. The daily average sick was 27·61, and the percentage of deaths to total treated was 7·11.

Lunatic Asylum, Colombo.—During 1902, 165 patients were admitted into the Asylum, which, with 463 remaining from the previous year, made the total insane population 628, of whom 410 were males and 218 females. The daily average number of inmates was 479·28. Of the total treated, 93 were discharged recovered (62 males and 31 females). There were 52 deaths, and 483 remained under treatment at the end of the year.

The institution consists of 18 dormitories, 20 day-rooms and corridors used as day-rooms, and 134 single rooms. The new block of cells on the female side which was completed last year was occupied throughout the year. The water supply is drawn from the Labugama reservoir, which supplies the town. The quality is good. The Superintendent complains the water supply is not sufficient; this is due to the want of pressure in the mains, and has been reported. There are 19 lavatories, 17 baths, and 19 latrines. The dry-earth system is carefully carried out. The number of patients secluded under lock and key was 14, and the number of times seclusion was resorted to was 104, and the longest duration in any single instance was six hours. There were three cases of accidental injury to the patients by themselves, four of injury to patients by other patients, and none by attendants. One case of suicide occurred during the year. Such patients as are well enough are given daily exercise, while others are confined to the airing courts. Outdoor sports (cricket and tennis) as well as indoor games (cards, bagatelle, musical instruments, &c.) are provided. A gramophone was purchased from industrial funds, and it continues to be a source of amusement and wonder to the patients. A library is in existence, and those who can read are regularly supplied with books and papers, but it has not been availed of to any large extent. The inmates of the Asylum are employed in gardening, trade, house work, &c., and the proceeds of their industry is formed into a fund, which at the end of the year amounted to Rs. 18,080·03 :—

Houses of Observation for Suspected Lunatics.—There were four institutions of this nature at Colombo, Kandy, Galle, and Jaffna, into which were admitted for observation 315 patients, which, with 10 remaining from the previous year, made a total of 325, of whom 103 were transferred to the Asylum at Colombo, 198 were discharged, 4 died, and 20 remained under observation at the end of the year.

Leper Asylum, Hendala.—The Leper Asylum received 106 patients for treatment during the year, which, with 276 remaining from the previous year, made the total leper population 382. The daily average in the Asylum was 225·25. Of the total treated, 30 were discharged improved, 41 died. Of those returned as discharged, 22 absconded, 2 were on leave and subsequently re-admitted, 4 were

sent back to their homes in India at their own request, 1 non-leprous patient was discharged by authority, and 1 was removed with the consent of Government for segregation in his own house, and there remained at the end of the year 311 patients under treatment. The Asylum has 332 beds. The water supply is ample, and the quality pure. There are bathrooms in connection with the Asylum supplied with hot and cold water according to the requirements of patients. The dry-earth system is in use, the excreta being disposed of by incineration.

De Soysa Lying-in Home.—The total number of patients treated at this institution during the year was 737, against 499 in 1901 and 163 in 1890. Of these, 695 were discharged cured, 2 removed cured, 4 removed to the General Hospital, 9 died, and 16 were remaining under treatment at the end of the year. The daily average sick was 15·52. The percentage of deaths to total treated was 1·25, against ·80 in 1901 and 3·08 in 1890.

This institution is becoming most popular, and its usefulness is much appreciated by the poorer residents in Colombo and its neighbourhood. The number of Moorish women seeking admission increases every year. A new small ward and operating room were opened during the year.

In the Lying-in Home 14 pupil midwives received training in 1902, of whom 13 obtained certificates after passing a satisfactory examination.

The following operations were performed during the year :—

Forceps extractions	124
Version	19
Craniotomy	3
Evacuation	14
Removal of placenta	10
Acceleration of labour by water bags	8
Total ...	178

Lady Havelock Hospital.—In this institution 1,072 patients were treated, against 1,030 in the previous year. Twenty-seven remained from the previous year, and 1,045 were new admissions. The daily average sick was 31·26. Of the total treated, 958 patients were discharged. There were 83 deaths, and 31 remained under treatment at the end of the year. Of the 1,072 patients, 320 were children (129 boys and 191 girls). There were 40 operations performed, with 1 death.

Police Hospital, Colombo.—740 patients were treated in the Police Hospital, of whom 728 were discharged after treatment, 1 died, and 11 remained at the end of the year. The daily average sick was 16·23. At the outdoor dispensary of this hospital 2,095 persons were treated during the year, who paid 2,478 visits.

Grenier Eye, Ear, and Throat Infirmary.—At this institution 4,927 cases were treated during the year, as against 4,336 in the previous year. The contributions during the year amounted to Rs. 124·72, and were of a purely voluntary nature.

Branch Hospitals.—Colombo, Kandy, and Galle are provided with a special hospital for the treatment of women suffering from venereal diseases. The total number of new cases admitted was 351, which, with 20 remaining from the previous year, makes a total of 371. Of these, 351 were discharged, and 18 remained under treatment at the end of the year. Of the 371 females treated in the three Branch Hospitals, 27 were treated for primary syphilis, 68 for secondary syphilis, 62 for tertiary syphilis, 4 for inherited syphilis, 156 for gonorrhœa, and 54 for other diseases the result of venereal poison.

Jail Hospitals and Sick Prisoners.—The number of prisoners admitted during the year into the different jails in the Island was 12,766. The average daily strength of prisoners was 2,656·40. There were treated during the year in the several Jail Hospitals 5,363 prisoners, against 4,638 in the previous year. The deaths numbered 117, against 112 in 1901.

The following table gives the number of admissions, number of deaths, average strength, death-rate to admissions to hospitals, and to average strength for the past four years :—

Year.	Admissions to Hospitals.	Number of Deaths.	Average Strength of Prisoners.	Death-rate to Admissions.	Death-rate per 1,000 of Average Strength.
1899 ...	4,362 ...	95 ...	2,591·53 ...	2·17 ...	36·65
1900 ...	4,465 ...	102 ...	2,515·14 ...	2·28 ...	40·55
1901 ...	4,638 ...	112 ...	2,752·71 ...	2·41 ...	40·69
1902 ...	5,363 ...	117 ...	2,656·40 ...	2·18 ...	44·05

Kalmunai Leper Ward.—At this institution 30 lepers were treated during the year, of whom 19 were discharged relieved, 2 died, and 9 remained under treatment at the end of the year.

Friend-in-Need Society's Hospital at Jaffna.—The Friend-in-Need Society's Hospital at Jaffna received 1,567 patients, which, with 64 remaining from the previous year, made a total of 1,631. Of these, 1,509 were discharged, 49 died, and there remained under treatment at the end of the year 73 patients. At the outdoor dispensary of this institution 8,056 persons were treated during the year, who paid 15,067 visits, and contributed voluntarily Rs. 1,474·83.

Kanatta Infectious Diseases Hospital.—At this institution 16 cases of infectious diseases remained from the previous year, and 837 were admissions, making a total of 853. Of these, 802 were discharged cured, 40 died, and 11 remained in the hospital at the end of the year. The death-rate was 8·77 per cent. Of the 853 patients, 120 were treated for smallpox, 560 for chickenpox, 118 for measles, 3 for whooping cough, 12 for mumps, 6 for acute diarrhœa, 27 for observation for smallpox, and 7 for observation for cholera. Of the 120 cases of smallpox, 32 died. Two cases of smallpox were remaining in hospital from the previous year.

Total Deaths.—The total deaths numbered 6,560, against 8,092 in the previous year, showing a decrease of 1,532. I subjoin a table showing the death-rate in the various hospitals and asylums in

the Island for the year, as compared with the previous year. I have separated the death-rates among the mixed races and Malabars for purposes of comparison :—

Hospitals.	Mixed Races.		Malabars.		Total.	
	1901.	1902.	1901.	1902.	1901.	1902.
Civil	5·92	5·59	18·60	16·01	9·06	8·18
Field	3·08	3·22	7·40	9·97	3·23	3·86
Immigrant	1·86	3·71	10·48	6·37	4·39	4·52
District	6·28	4·60	28·98	21·97	23·69	16·88
Asylums	12·57	7·49	14·28	8·37	11·54	7·61
Total ...	5·62	5·26	22·94	18·25	12·18	9·87

The percentage of deaths to cases treated in the Civil Hospitals showed a slight decrease among the mixed races and a decrease of 2·59 among the Malabars. In the Field Hospitals the increase among the mixed races was slight, and that among the Malabars was 2·57. In the Immigrant Hospitals the increase among the mixed races was 1·85, but among the Malabars there was a decrease of 4·11. In the District Hospitals there has been a decrease of 1·68 among the mixed races and 7·01 among the Malabars. Taking all the hospitals and asylums together, there was a slight decrease among the mixed races and 4·69 among the Malabars. The percentage of deaths to total treated was 9·87, against 12·18 during the previous year.

Hospital Accommodation.—This was generally sufficient; occasionally some overcrowding took place. This especially applies to the General Hospital, Colombo. Although two new temporary wards have been opened during the year, containing room for 84 beds, overcrowding still continues.

Water Supply.—With the exception of the following institutions, Matale, Mannar, Galle, Chilaw, Nikaweratiya, Trincomalee, the water supply in all the hospitals was reported to be good, pure, wholesome, and abundant. Water for drinking purposes is, as a rule, boiled and filtered before use.

Bathrooms.—All hospitals are provided with separate bathrooms for males and females and furnished with tubs, which are filled with hot or cold water according to the requirements of the patients. Patients who can help themselves, however, prefer to bathe in streams where there are such adjoining a hospital.

Drains.—There are no covered drains. The drains are all surface ones for carrying away the ward washings, rain, and storm water.

Sewage.—The conservancy of the latrines is entirely on the dry-earth system, the excreta being removed daily and buried or incinerated at some distance from the hospitals.

Inspection.—The hospitals were all inspected either by me, the Acting Principal Civil Medical Officer, or the Colonial Surgeons of the respective Provinces. The number of these visits of inspection and the official designation of the visitors will be found given in the return of each institution. The books were produced when called for, and were generally found complete and made up to the date of examination. The reports of inspection by the Colonial Surgeons as well as those by me were forwarded to Government when necessary.

Food Supply.—The provisions for the various hospitals were supplied by purveyors on contracts approved by Government. The system works satisfactorily. The medical officers in charge of the respective hospitals examine the food before it is served out to the patients, and reject such articles as do not come up to contract sample.

Dispensaries.—376 dispensaries were in operation. Of these, 215 were Civil, 44 District, and 117 Estate. They are distributed as follows :—In the Western Province 31, Central 52, Northern 38, Southern 35, Eastern 18, North-Western 25, North-Central 19, Province of Uva 21, and Province of Sabaragamuwa 20. In the Civil and District Dispensaries there were treated 975,160 persons, against 1,073,993 in the previous year, who paid 1,499,227 visits and contributed voluntarily Rs. 22,373·79. Estate Dispensaries were kept up on the estates by the planters, medicine being supplied free by Government, and the resident dispenser, who is paid by the estate, being appointed on the recommendation of the Principal Civil Medical Officer.

Port Duties and Immigration.—The number of vessels which arrived at the port of Colombo was 2,802, against 3,039 in the previous year, 2,375 being steamers and 427 native craft. The number of native traders was 60,672 and coolies 33,760. Included as traders were 52,140 men, 4,293 women, 3,194 children, and 1,045 infants. Of the coolies, 21,440 were men, 7,182 were women, 3,271 were children, and 1,867 were infants.

Ragama Camp.—The total number of coolies who passed through the camp during 1902 was 34,280, against 45,823 during the previous year. There were five distinct outbreaks of cholera during the year. Nineteen persons were attacked, of whom 13 died. These outbreaks occurred during the months of July and August. Of the other diseases admitted into the hospital, there were 4 cases of diarrhœa, 1 of fracture, 2 of fever, and 1 of pneumonia. Of the total number of coolies who passed through the camp, 1,411 persons were vaccinated, and the rest either had marks of successful vaccination or of smallpox. The drainage system of the camp is efficient. The conservancy is carried out on the dry-earth principle, the excreta being disposed of by incineration. There is a good and ample water supply. A new camp for coolies was completed during the latter part of the year.

De Soysa Bacteriological Institute.—Since its opening it has undertaken work of diverse character, and is now supplying a long-felt want in the Colony by its researches in Bacteriological analyses of tissues, secretions, blood, &c., so indispensable to scientific diagnosis of diseases; and the Acting Director, Dr. S. C. Paul, F.R.C.S., is consulted by Government medical officers and private medical practitioners for reports on specimens submitted by them on bacteriological and allied subjects.

Medical College.—Great improvements have been effected in this institution; new laboratories have been made out of the old lecture rooms, new apparatus has been obtained, and the number of lecturers has been increased. The teaching has been brought up to date. During the year 20 new medical students and 4 apothecary students entered the College. There were 87 medical and 37 apothecary students at the end of the year. The total fees amounted to about Rs. 16,000.

Civil Medical Stores.—Dr. H. M. Fernando was in charge of this institution as Medical Superintendent. Mr. A. D. Cotton is the Chief Storekeeper. The drugs, chemicals, and instruments received from England amounted to Rs. 149,463·05, from India Rs. 378·62. The cost of articles purchased from the Government Stores and the local market for the preparation of drugs in the Medical Stores came to Rs. 8,202·80, while the cost of repairing surgical instruments amounted to Rs. 40·25, and that of transport and postage to Rs. 3,611·04, contingencies and petty expenses to Rs. 539·96, the sale of medicine to Government Departments and others Rs. 473·09, and sale of medicine to planters Rs. 1,817·76. The sale of unserviceable articles realized Rs. 443·74, and the value of the surgical instruments lost and paid for by the officers of the Department amounted to Rs. 142·50.

Nursing.—Votes were asked for an increase of trained European nurses for the paying wards, General Hospital, and an increase in the number of the Religious Sisters, which have been approved.

Strength of the Medical Department.—The strength of the Medical Department was as follows:—1 Principal Civil Medical Officer and Inspector-General of Hospitals, 1 Assistant Principal Civil Medical Officer, 1 Registrar of the Medical College, 7 Colonial Surgeons, 1 Superintendent of the Lunatic Asylum, 1 Surgeon in charge of the General Hospital at Colombo, 2 Medical Women, 22 Assistant Colonial Surgeons, 28 Deputy Assistant Colonial Surgeons, 46 Sub-Assistant Colonial Surgeons, 24 Probationer Sub-Assistant Colonial Surgeons, 4 Health Officers, 248 Apothecaries, 1 Chief Medical Storekeeper, 1 Chief Inspector of Vaccination, 6 Inspectors of Vaccination, and 108 Vaccinators.

Changes in the Department.—The changes were the retirement of Dr. W. G. Keith, Colonial Surgeon, Southern Province, on 1st August, 1902, after thirty-two years' service, and the deaths of Sub-Assistant Colonial Surgeons J. S. Johnpulle and D. P. Nicholas in September and October respectively. Deputy Assistant Colonial Surgeon V. Saravanamuttu, M.D., retired owing to ill-health on 16th August, 1902. Dr. S. C. Paul, F.R.C.S., was appointed Professor of Anatomy of the Medical College.

The expenditure of the Department, exclusive of working hospitals under the Medical Aid Ordinance, amounted to Rs. 1,278,874·28, including exchange compensation, against Rs. 1,339,923·80 in the previous year. Under Personal Emoluments and Allowances the expenditure was Rs. 311,211·15, including exchange compensation, against Rs. 313,442·35 in 1901. The expenditure under Other Charges was Rs. 955,651·89, against Rs. 1,011,842·41 last year; under Harbour Service Rs. 800, against Rs. 1,803·22 in 1901; and under the vote for Plague Precautions Rs. 11,211·24, against Rs. 12,835·82 in the previous year.

The receipts on account of paying patients in hospitals amounted to Rs. 46,196·48, against Rs. 45,225·15 in 1901. The collections at the Civil Outdoor Dispensaries was Rs. 20,195·34, against Rs. 18,367·36 last year. The cost of medicines issued to the Estates Branch of the Department amounted to Rs. 111,585·27, against Rs. 110,605·77 in 1901, while the sale of medicines and superfluous articles, Medical College fees, &c., amounted to Rs. 49,443·30, against Rs. 41,682·62 last year. Deducting the receipts under the heads above specified from the expenditure, the nett expenditure was Rs. 1,051,453·89, against Rs. 1,124,042·90 in 1901.

The following statement shows the expenditure and receipts as compared with 1901 :—

EXPENDITURE.	1901. Rs. c.	1902. Rs. c.	Increase. Rs. c.	Decrease. Rs. c.

Prisoners of War.—Camps for prisoners of war existed at the following stations during the year :—Diyatalawa, Urugasmanhandiya, Mount Lavinia, Ragama, and Hambantota. The camp at Urugasmanhandiya was closed on the 5th November, that at Ragama on the 20th November, that at Hambantota on the 27th July.

The number of prisoners rapidly decreased towards the end of the year, and the average of all sick at the largest camp (Diyatalawa) was 196 per 1,000 for the whole year. At this camp the mortality from all causes, taking 3,423 as the daily average strength, was 7·59 per 1,000.

The general health of the camps was satisfactory. Enteric fever was absent at Diyatalawa until April, when there was a re-appearance. The cause was traced to infection outside the camp. There were 46 cases, with 6 deaths.

Dysentery was prevalent, and towards the end of the year assumed a bad type and contributed largely to the death-rate.

The total number of cases treated in hospital (Diyatalawa) was 718, and at the outdoor dispensary 994. Five cases of mania and melancholia occurred. One death was due to tumour of the brain. One death was due to intestinal obstruction, for which an abdominal section was performed. The admissions at the other hospitals were very small. The sanitation of the camps was satisfactory. The water supply and food were of good quality.

ESTATES BRANCH.

During the year 1902 there were 1,763 estates scheduled to 33 districts and 31 sub-districts, with 20 District Hospitals and 29 District Dispensaries and 13 Civil Hospitals and Dispensaries.

The following are the districts and sub-districts, with the number of estates scheduled to each :—Avisawella District 47, sub-district Hanwella 10, sub-district Bandaragama 11, sub-district Horana 6 ; Kalutara District 40, sub-district Horawella 4 ; Kandy District 72, sub-district Galagedara 15, sub-district Kadugannawa 20, sub-district Hanguranketa 3 ; Elkaduwa District 21, sub-district Wattegama 29 ; Kelebokke District 44 ; Dikoya District 62, sub-district Bogawantalawa 31, sub-district Watawala 39 ; Maskeliya District 73 ; Gampola District 56, sub-district Pussellawa 34 ; Lindula District 56, sub-district Agrapatana 43 ; Dimbula District 54 ; Matale District 81, sub-district Rattota 32, sub-district Gammaduwa 18 ; Teldeniya District 28, sub-district Rangalla 26 ; Deltota District 42 ; Nuwara Eliya District 37, sub-district Nanu-oya 18 ; Maturata District 30 ; Ramboda District 35 ; Uda Pussellawa District 32, sub-district Mulhalkele 3, sub-district Maspana 1 ; Nawalapitiya District 49, sub-district Dolosbage 36 ; Kotmale District 18 ; Morawak Korale District 16, sub-district Deniyaya 2 ; Balapitiya District 16 ; Elpitiya District 1 ; Udugama District 13 ; Badulla District 59, sub-district Pingarawa 24, sub-district Passara 10 ; Lunugala District 13, sub-district Madulsima 29 ; Monaragala District 10 ; Haputale District 17, sub-district Bandarawela 8, sub-district Haldummulla 23, sub-district Koslanda 27 ; Kurunegala District 41, sub-district Rambukkana 2 ; Ratnapura District 22 ; Balangoda District 33 ; Rakwana District 25 ; Kegalla District 22 ; Karawanella District 63, sub-district Kitulgala 17, sub-district Aranayaka 18.

To attend to the medical wants of the above the following officers were employed :—Deputy Assistant Colonial Surgeons 15, Sub-Assistant Colonial Surgeons 10, and Apothecaries 28.

During 1902 there were 10,995 estate labourers treated in the District Hospitals and Civil constituted District Hospitals, against 12,017 in 1901. Of these, 2,375 died, a death-rate of 21·60 per cent. Of the mixed races, 14,656 were treated, of whom 824 died, a death-rate of 5·62 per cent.

In the Civil Hospitals worked partly as District Hospitals the death-rate of estate labourers was 21·71 per cent., whilst in the District Hospitals it was 21·55 per cent. The highest death-rate (30·34 per cent.) among the estate labourers occurred in the District Hospital at Nawalapitiya, and the lowest (1·38 per cent.) in the Civil Hospital at Galle. The admissions into the former were 468, into the latter 72. In the Civil Hospital, Kalutara, and the District Hospital, Dimbula, there were no deaths among estate labourers. The admissions into the former were 7 and into the latter 302.

The total number of days the estate labourers stayed in hospital was 266,920, an average of twenty-four days. Of these, 185,286 persons were paid for by the estates, the rest being charged to the fund. The total number of days mixed races stayed in District Hospitals was 184,051, an average of twelve days.

The total number of estate labourers treated at the outdoor dispensaries was 44,726. The total number of estate labourers treated on estates was 17,344.

The total number of births reported from estates was 6,691, of which 3,418 were males, 3,176 were females, and 97 were still-births.

The number of deaths reported from estates was 9,428, of whom 4,599 were males, 4,828 were females, and in 1 case the sex was not stated.

The expenditure under the Medical Aid Ordinance amounted to Rs. 518,614·99, including exchange compensation, and receipts to Rs. 339,645·22, derived from the following sources :—Export duty Rs. 142,013·59, hospital charges for treatment of coolies Rs. 59,674·50, recovered for visits paid to estates Rs. 21,748, sale of unserviceable and superfluous articles Rs. 154·92, medicines sold to

superintendents of estates Rs. 1,809·89, medicines sold in bulk to superintendents of estates Rs. 8,548·93, and prescriptions compounded Rs. 2,741·37, dispensary collections Rs. 2,178·45, cost of maintenance, medicine, and funeral expenses of other than estate labourers Rs. 96,719·14, recoveries for maintenance of others Rs. 4,056·43. The nett expenditure was Rs. 178,969·77. 117 dispensaries are now established in the planting districts.

Appended are Tables I. and II. showing the receipts and expenditure of the Estates Branch of the Department.

ALLAN PERRY, M.D., D.P.H.,
Principal Civil Medical Officer and
Inspector-General of Hospitals.

Colombo, April 30, 1903.

APPENDIX.

PROVINCIAL REPORTS.

(1) WESTERN PROVINCE.

This Province is under the supervision of Colonial Surgeon G. P. Schokman, M.B., C.M., whose report is subjoined :—

Population.—The estimated population of the Western Province for the year was 940,045. The number of births and deaths registered during 1902 was 33,216 and 21,274 respectively, and the birth- and death-rates per mille 35·6 and 22·8.

Prevalence of Sickness.—In my report for last year I had the pleasure of reporting that the general health of the Province was excellent. This condition continued throughout the year in all stations and parts of this Province. There was an entire absence of outbreaks of malarial fever, and even the unhealthy and low-lying district of Negombo was free from it. The rainfall was abnormally abundant, and no ill-effects appear to have resulted therefrom.

Dysentery.—In the months of January, February, November, and December dysentery prevailed in the villages of Attygala, Jaltara, Henpita, and Hanwella of the Hewagam korale, due to drinking contaminated water from surface wells which were covered by the heavy floods. The outbreak was not severe, and there were no deaths. Two rather extensive outbreaks of dysentery occurred in the Moratuwa district, viz., one in the early part of the year in the villages Jambureliya and Mampe, the other at Siddamulla. In the latter place there were five deaths, and the poor received assistance from Government, while they were treated by their own native doctors. Dysentery also prevailed in the villages of Wadduwa, Mahabellana, Waskaduwa, and Ponwatta of the Panadure district, and to some extent in the town of Panadure.

Enteric Fever.—This disease prevailed throughout the town of Colombo to a greater extent than usual. In Horatuduwa, a village close to Moratuwa, there was an epidemic traced to drinking water from polluted wells. The type of the disease was not severe. The disease soon disappeared with a change in the source of the water supply. In the crowded town of Moratuwa enteric fever is endemic, and out of 704 deaths registered during the year 43 deaths were from this disease. At the Reformatory at Maggona during August and September several cases of enteric fever occurred among the juvenile offenders confined there. Eleven cases were transferred to the Kalutara hospital, and two of them died. The diagnosis in all cases was confirmed by Widal's reaction. Both the Principal Civil Medical Officer and myself visited the Reformatory twice, and were satisfied with the sanitary arrangements of the place. A medical officer was stationed at the Reformatory while the outbreak lasted.

Chickenpox.—This disease was widely distributed, and occurred chiefly in the town of Colombo, Mahara prison, Panadure, Kalutara, Henaratgoda, Veyangoda, and Hanwella. 1,057 cases were reported.

Smallpox.—In hospital two cases of smallpox remained over from the previous year. 122 cases were admitted, of which 32 died. No cases were remaining at the end of the year.

The first case admitted into hospital on the 19th January was a Malabar cooly from Cheku street, a recent arrival from India. The infection spread from this case to several parts of the city, especially Alutmawata, Grandpass, and Slave Island. The disease was stamped out in November. Two cases included in the admissions into Kanatta came from the port, one the chief officer from the ss. Hawick Hall from Calcutta, the other a lascar from the ss. Ville de la Ciôtat from Marseilles.

A child suffering with smallpox was clandestinely removed from Colombo in the month of July to Wehera, a village in the Moratuwa district. This case died and was buried, and the cause of death attributed to measles. Two other cases occurred in the same house. Both these cases recovered. The parents of the child were prosecuted and fined. No other villages were infected. Two cases of

smallpox occurred in the town of Negombo ; the first case was a trader who returned home from India and took ill a few days after. Both cases recovered. The usual precautions by vaccination, segregation, and observation were carried out successfully.

The following is the number of cases of smallpox, modified smallpox, and chickenpox treated and died in the Province during the year :—

	Total treated.	Total died.
Smallpox	76 ...	32
Modified smallpox	46 ...	—
Chickenpox	1,057 ...	3

Cholera.—An outbreak of cholera occurred at Negombo at the beginning of the year, and continued up to the middle of March. There were 40 cases, with 32 deaths. The disease was introduced from Chilaw by a boatman who was being taken to Colombo ill with the disease. The patient, who was in a padda boat in the Negombo lake, was visited by a resident of Negombo, who contracted the disease. From this source it spread, the localities chiefly infected being Grand street and St. Joseph's street in the neighbourhood of the canal. There were 4 deaths from this disease at Wadduwa in the Panadure district, and 2 deaths in Waskaduwa and Kalutara ; all these cases were traced to Negombo.

Ragama Camp.—There were six outbreaks of cholera during the year :—

	Cases.	Deaths.
First outbreak, July 5	2 ...	1
Second do. July 11	13 ...	10
Third do. July 16	1 ...	0
Fourth do. July 20	1	1
Fifth do. August 7	1 ...	1
Sixth do. October 20	1 ...	—
Total ...	19	13

These cases occurred in gangs of coolies who came from infected areas. The total number of coolies who passed through the camp during the year was 34,280. Of this number, 3,623 were quarantined, having come either from cholera- or plague-infected areas.

Particular Disease.—During the north-east monsoon acute serous diarrhœa was prevalent in several parts of the Province. In Negombo town it lasted for two months, April and May. There were 52 cases, with 32 deaths. Specimens of excreta and spleen were forwarded for bacteriological examination, which did not prove them to be cholera. Similarly, it prevailed for two weeks, from 21st February to 4th March, at Egoda Uyana, a populous village in the Moratuwa district. There were 20 cases, with 9 deaths. Everything possible was done : a fresh supply of water from another locality was distributed as long as the disease prevailed, apothecaries were placed on special duty, and the needy provided with food. The disease was peculiarly confined to this village, which was exposed and by the seashore. In the convict prisons an unusually large number of cases occurred during the year. There were 31 cases, with 7 deaths.

Sanitary Condition of the Chief Towns.

Colombo.—Though the city maintained its reputation as one of the healthiest cities in the East, yet considerable sanitary improvements are required before it can be pronounced an ideal city. The appointment and assumption of duties of two highly qualified medical officers of health for the city, it is expected, will result in improving its sanitary condition and removing all sources of nuisance. The duplication of the main now in hand will give the city a larger and more regular supply of water, and it is hoped that all wells in the crowded parts of the city will then be closed, as the source of enteric fever so prevalent in the city has always been traced to contaminated water or milk. The cumbersome system of conservancy now worked by the Municipality will soon be displaced by the Mansergh system of water carriage, so far at least as the crowded parts of the city are concerned.

Panadure.—This town remains the same year after year, and I have nothing new to chronicle, except to state that the sooner a Board of Health is appointed the better it will be for the residents of the place.

Moratuwa.—I cannot do better than refer to my remarks of the previous year.

Negombo.—A considerable number of large surface drains were constructed in this town with the view of carrying off the rain water which collected and lodged on the surface for days. Every endeavour is made to improve the drainage of this low-lying town. The source of water supply for drinking is from wells outside the town, and is of good quality. A scheme for obtaining water from Dandugama-oya, 8 miles from town, is under consideration.

Kalutara, Avisawella, and Minuwangoda.—Nothing new to record.

Other Institutions.

I annex reports from the Surgeon in Charge and the staff of the General Hospital, the reports of the Superintendents of the Lying-in Home and Leper Asylum, and the Medical Officer of the Lady Havelock Hospital. I annex also the report of the Port Surgeon.

The Port.—One case of suspected plague in a cabin boy on board the M. M. ss. Polynesien, evidently infected at Hongkong, and manifesting symptoms immediately after the ship left Singapore, was detected on her arrival. The vessel was placed in strict quarantine, took in coal and water by means of her own crew, and left for Galle. The patient was admitted into the plague hospital there, and a party of thirty Chinese passengers for Ceylon were landed and placed in quarantine. The ship then left. I inspected this case with the Port Surgeon.

The Jails.—The convict prisons were maintained in a good sanitary state. The drainage of the Welikada prison was completed, and extra windows were put into the Mutwal prison wards to improve their ventilation. Pneumonia, which usually affected the prisoners at Mutwal, was entirely absent this year, whereas an outbreak occurred in the Mahara prison. There were in this prison

24 cases, with 15 deaths. Diarrhœa and dysentery, as in previous years, formed the greatest admissions into the hospital, and a percentage of the diseases to the strength of the prisons for the past five years shows :—

Year.	Diarrhœa. Per Cent.	Dysentery. Per Cent.
1898	5·10 ...	3·08
1899	3·08 ...	4·73
1900	5·76 ..	5·77
1901	4·25 ...	3·95
1902	4·68 ...	3·72

Vaccination.—Twenty-nine vaccinators, including one female vaccinator, were employed in the Province, and of these eight worked in the city of Colombo. One extra vaccinator was employed during the outbreak of smallpox at Colombo. Two out of the twenty-nine vaccinators worked on estates.

During the year 50,076 persons were vaccinated, 43,043 primary and 7,033 re-vaccinations. Of the 43,043 primary vaccinations, 23,951 were males and 19,092 females. The ratio of success to those inspected were 95·33 for vaccinations and 78·02 for re-vaccinations. In the city 17,174 persons were vaccinated, an increase of 677 over the previous year.

The work of calf vaccination had been carried on under difficulties owing to unsuitable premises and insufficient space. 148 calves were vaccinated, and 3,914 tubes of glycerinated paste prepared, which was sufficient not only for local demands, but served to supply other Provinces, private practitioners, the Military, and the Boer and Ragama cooly camps.

A vote has been included in the estimates for 1903 for erecting a central vaccine depôt, and it is hoped that the work will be completed before the expiration of the year.

---

(2) CENTRAL AND NORTH-CENTRAL PROVINCES.

These Provinces are under the supervision of Colonial Surgeon J. Craib, M.D., whose report is subjoined :—

In submitting my annual report for the year 1902, I have the honour to state that, excepting for an outbreak of cholera on Pallekele estate, the general health of the two Provinces under my charge has been fairly satisfactory. There was no smallpox during the year, but a few cases of chickenpox were reported from Hanguranketa and Galagedara districts. Measles, too, prevailed in a few of the districts, but not to any extent.

Population.

The estimated population for the year, as per figures obtained from the Registrar-General, is as follows :—

	Central Province.	North-Central Province.
Population (at the middle of 1902)	626,278 ...	79,452
Births registered, 1901	13,045 ...	3,803
Do. 1902	14,582 ...	3,404
Deaths registered, 1901	12,467 ...	3,041
Do. 1902	11,507 ...	3,396
Birth-rate per 1,000, 1901	32·4 ...	47·9
Do. 1902	36·1 ..	38·1
Death-rate per 1,000, 1901	30·1	38·3
Do. 1902	29·4 ...	42·7

Prevalence of Sickness.

The diseases most prevalent were malarial fever, diarrhœa, and dysentery, pneumonia and catarrhal affections, rheumatism, and cutaneous affections.

Malarial Fevers did not prevail to such an extent as in preceding years, and did not require the employment of itinerating medical officers, as it at no time assumed an epidemic form.

Parangi prevailed in the North-Central Province and adjacent parts of the Central Province, and appears to be on the decrease, judging from the reduced number treated for the year.

Diarrhœa and Dysentery existed among the estate labourers, especially during the wet seasons, and was principally due to dietetic and climatic causes; neither of them assumed an epidemic form.

Respiratory Diseases and Rheumatism were caused by exposure to changes of temperature, and were mainly seen in the higher districts of the Central Province.

Anchylostomiasis occurs largely among the Tamil labour force, and is constantly being imported from the coast by new arrivals, and is now extending to the villagers, especially among those who work or reside on the estates. The causes are due to pollution of soil and water, by fœcal matter, and if the native could only be educated to use latrines this disease would be considerably reduced.

Relative Mortality in the Different Seasons.

Owing to the absence of the necessary data from the Registrar-General under this heading, I regret I am unable to furnish any statement.

Meteorological Conditions and Effects on Public Health.

The two first quarters offered no special features for framing my observations, but the two last quarters of the year were characterized by exceptionally wet weather, and consequently gave rise to much sickness in the several districts. Respiratory, intestinal, and arthritic affections prevailed largely, while malarial fevers on the other hand succeeded the wet seasons and caused the usual outbreaks of fever to appear.

Particular Diseases.

There was no smallpox in the two Provinces. Chickenpox existed in Matale, Hanguranketa, Maturata, Rattota, Nawalapitiya, Lindula, Kandy, Gampola, and Nuwara Eliya Districts. 649 cases were reported from the Central Province, and only three from the North-Central Province.

Cholera occurred on Pallekele estate, having been introduced by new arrivals; it began on 12th October and ceased on 9th November. It, however, broke out afresh in December, and continued until beyond the end of the year. There were in all 22 cases up to 31st December, with 12 deaths.

In every instance the cases were seen by the Colonial Surgeon, who took active steps to prevent the spread of the disease.

A few epidemic cases of measles also occurred throughout the two Provinces.

Leprosy.—A few cases were reported from various districts, and all were either transferred to the Leper Asylum at Hendala or returned to the Coast, as the subjects were mostly Malabars or Coast Moors.

Mumps occurred in the Kandy District and Bogambra jail. In the latter there were 53 cases, all of whom were transferred to the Infectious Diseases Hospital for treatment. This disease was introduced into the jail by local admission.

Sanitation.

Sanitation was on the whole fairly satisfactory. Several improvements were effected during the year under review, and damaged drains were replaced by egg-shaped cement ones. Several Horbury latrines were supplied. The scavenging was given out on contract, and was satisfactorily done. In addition, the several points indicated in my last report were continued to be carried out during this year, and contributed thereby to a better state of sanitation. The water supply, however, still continues to be a subject of discussion, and nothing was done to improve it during the year.

Kandy.—Water supply remains the same. Drainage remains unimproved. Alleys still numerous and insanitary with defective drainage. Cesspits, where practicable, were replaced by dry-earth system. Overcrowding continues in alleys, laundries, and eating-houses; slaughter-houses are satisfactory, and were regularly inspected by the Municipal officers. Conservancy of town is satisfactorily performed.

Matale.—Drainage still defective. Water supply inadequate. It is contemplated to acquire an estate, where the water supply is pure, wholesome, and sufficient. Several cesspits still remain, but are being gradually replaced by Horbury latrines and dry-earth system.

Gampola.—Drainage is being generally improved upon, but is still defective.

Nawalapitiya.—Water supply sufficient, and is carried to the town by pipes. Drainage still defective, but is gradually improved as funds permit. A few public latrines were erected.

Hatton and Dikoya are conjointly managed by a Local Board. Drainage is being improved upon, though still defective. Horbury latrines were erected. Water supply is still very defective, and is polluted by surface drainage unless obtained from wells.

Maskeliya, Kotagala, Talawakele, and Lindula.—The drainage in these towns has been improved, and Horbury latrines were erected. The water supply, however, is still defective, especially in the two latter towns.

Nanu-oya remains the same, with the exception of a Horbury latrine being provided.

Nuwara Eliya remains much the same. Latrine accommodation still insufficient, and drainage defective.

Kadugannawa.—Drainage much improved, but still defective. Water supply is obtained from wells.

Dambulla, Rattota, and Wattegama.—Drainage unimproved, and no latrine accommodation has been supplied. Water supply unsatisfactory and defective.

Anuradhapura.—Drainage defective, but being generally improved. Increased latrine accommodation was provided. Conservancy of town is satisfactorily carried out.

Mihintale remains unimproved.

Vaccination.

During the year vaccination in the two Provinces was satisfactorily carried on by medical officers, apothecaries, and vaccinators. The female vaccinator operated amongst the Moorish and other communities in Kandy, Matale, Gampola, Nawalapitiya, and Hatton.

The total number vaccinated was males 12,228, females 11,819, total 24,047, showing an increase of 2,257 on the previous year. There were only 16 re-vaccinations, with a percentage of 56·25 success. The percentage of successes in primary vaccination was 96·01.

There were 57 reports against headmen and 169 cases of prosecutions of defaulters.

Animal Vaccine Depôt.

Fifty-five calves were vaccinated, with 1,245 successful vesicles. 1,195 tubes of lymph were collected, and all were issued to the several vaccinators.

Jails and Jail Hospitals.

Kandy.—The number of prisoners confined in the Bogambra jail during the year was 2,165, and in the old jail 1,144. The daily strength was 412·12, and 59·96 respectively. There was no overcrowding in either of the jails. The number treated during the year was 807, giving a daily average of 20·83, with a percentage of deaths of 3·34. The diseases most prevalent were bowel complaints, respiratory diseases, fever, mumps, and chickenpox. All the infectious diseases were transferred to the Infectious Diseases Hospital, Kandy. The general health of the prisoners during the year was, on the whole, satisfactory.

Anuradhapura Jail.—156 were confined during the year, and the daily average strength was 10·22. There were 12 cases treated during the year, and the average daily sick was ·29. The diseases most prevalent were dysentery, fever, and diarrhœa. There was only one death for the year.

Nuwara Eliya.—Health of prisoners was satisfactory. There were 52 cases treated, daily average sick being 1·38, with no deaths, and the daily average strength of the jail was 32·03.

Hospitals and Dispensaries.

The Civil Hospital, Kandy, has had several improvements effected during the year, viz., a new dysentery ward for females was built and opened. Several wards had the old tiles removed and Calicut tiles substituted, and the corridors and verandahs were cemented.

Matale Hospital.—Three new permanent wards were built and nurses' quarters provided. The administration block and dispenser's quarters are in course of erection. The old nurses' quarters were converted into a ward.

Gampola Hospital.—Nothing has been done to this institution during the year. The temporary wards should be replaced by permanent ones, as they are in a dilapidated condition.

Nawalapitiya Hospital.—An extra ward for females is needed.

Teldeniya Hospital.—Two new wards for male and female diarrhœa cases are required, as the existing accommodation is insufficient.

Dikoya Hospital.—This hospital is insanitary and beyond repair, and a new one should be built at an early date.

Dimbula Hospital.—An extra room for dispenser is required.

Maturata Hospital.—This new hospital was opened during the year.

Uda Pussellawa Hospital.—The old building should be replaced by a new permanent one, and new medical officer's quarters built.

There was only one new dispensary opened during the year, viz., Mendugoda. The following dispensaries should be replaced by new permanent buildings, viz., Galawela in the Central Province, and Yakalla, Tambuttegama, Eppawela, and Nochchiyagama in the North-Central Province.

---

(3) NORTHERN PROVINCE.

This Province is under the supervision of Acting Colonial Surgeon F. G. Spittel, L.R.C.P. and L.R.C.S., whose report is subjoined :—

In submitting my annual report for the Province under my supervision for the year 1902, I have the honour to state that I assumed duties as Acting Colonial Surgeon on the 13th June, 1902.

Population.

The estimated population for the three districts of this Province for the year is 348,789. The number of births registered was 13,301 and deaths 9,392. The birth-rate per 1,000 was 38·12, and the death-rate 26·92.

The following table supplied by the Provincial Registrar gives the particulars for each of the three districts :—

		Jaffna.	Mannar.	Mullaittivu.
Population	1901	305,809	24,885	15,186
	1902	308,675	24,978	15,136
Births	1901	12,985	942	660
	1902	11,764	979	558
Deaths	1901	7,134	1,185	648
	1902	7,898	886	608

Prevalence of Disease.

With the exception of an outbreak of cholera that occurred during the previous year and continued till this year, the health of the inhabitants has been satisfactory.

Malarial Diseases.—Malarial fever is endemic in the Northern Province, and prevails to a great extent after the burst of the north-east monsoon during the first and last quarters of the year. All types of the disease occurred, the most prevalent being quotidian and tertian. The returns of the different hospitals and dispensaries show that 43,300 cases were treated, against 40,831 cases the previous year, or an increase of 2,529. The largest numbers were treated at Pallai, Valuvettiturai, Jaffna, and Silavaturai.

Diarrhœa and Dysentery.—These diseases are most prevalent during the wet season from October till January. They are principally attributable to climatic changes, impure water, and unwholesome food. During the year 3,411 cases were reported from all hospitals and dispensaries of the Province. The largest number (539) was reported from Pallai.

Parangi.—This disease still prevails to a great extent, especially in the Vanni. The total number treated during the year was 1,586, of which 210 were treated at Kokulai. The places which are quite free from the disease are Delft, Kayts, Marichchukaddi, Nainativu, Vilankulam, Pallai, Pungulutivu, and Valuvettiturai. A very small number of cases were reported from Batticotta, Jaffna, Palavarayankadu, Point Pedro, Punakari, Puttur, Silavaturai, Vankalai, and Vidattaltivu. Most of the cases treated in these stations were the inhabitants of other places who went to the dispensaries for treatment while passing them.

Itch.—This disease prevails to a great extent in the northern parts of the Province, especially in Jaffna and Point Pedro.

Pneumonia and Bronchitis prevail to some extent generally during the wet months, and are due to sudden changes of temperature. 345 cases of pneumonia were reported from twenty-four stations, of which 58 were reported from Kayts and 56 from Pallai.

Relative Mortality in the different Seasons.

In this Province practically there are two seasons, the wet and the dry. The wet season begins after the burst of the north-east monsoon in October, and lasts till February, the rainfall being highest in November and December. Although after the setting in of the south-west monsoon there are occasional showers of rain, the dry season may be said to begin in March and end in September.

The mortality is highest during the first and last quarters of the year; this is due chiefly to the prevalence of malarial fever, chest affections, and bowel complaints. The third quarter, which is the hottest part of the year, is the healthiest, and usually the death-rate during this quarter is low.

Particular Diseases.

Cholera, which broke out in the village Achchuveli on the 1st and at Kayts on the 11th December, 1901, continued till this year, and ended almost simultaneously on the 13th and 14th January. From 1st January 7 cases occurred at Achchuveli, of which 4 proved fatal, and at Kayts there were 29 cases, with 14 deaths.

Smallpox.—Two cases of smallpox occurred in the Province during the year, one at Manipay and the other at Tillupulli. The case at Manipay was reported on the 10th February. The patient, a resident of Manipay, visited Penang, from where he returned to Colombo on the 26th January, and came to Manipay on the 30th of the same month. On the 4th February fever set in, followed by the eruption of the disease. The case at Tillupulli, a resident of that village, went to Colombo, where he remained for three weeks, and embarked in the ss. Lady Gordon on the 7th March and proceeded to his village the same day. He was seized with the disease on the 21st of the same month. Both patients were promptly removed to the Infectious Diseases Hospital, and were discharged cured. The inmates of the houses occupied by the patients were quarantined; they as well as the people in the neighbourhood were vaccinated, sanitary measures were vigorously carried out, and the disease in both villages was at once stamped out.

Measles, Mumps, and Chickenpox were reported from several stations; in most of them the cases were sporadic, and nowhere did they prevail to any great extent.

Fish Poisoning.—Six cases of fish poisoning occurred on the 13th October in the adjoining villages Alvai and Karavady, which are situated two miles south of Point Pedro. All the patients, a few hours after partaking of some fish which was obtained from the Point Pedro market, were seized with gripe, dizziness, vomiting, and purging. One expired within nine hours after the symptoms set in, and three within eighteen hours; the rest recovered, and were quite well on the third day. It was not possible to identify the fish, as it was sold cut up in small pieces.

General Sanitary Condition of the Province.

Jaffna is the only town in the Province in which some system of sanitation is carried on, and even here the system can be much improved. Although several attempts have been made, no Municipality or Local Board has yet been established. The sanitary condition of several localities is anything but satisfactory. The fishers' quarter, Karaiur, seems to be the most insanitary part of the town. This locality is greatly overcrowded, the houses are small and ill-ventilated, the high cadjan fences round them and large trees shut out sunlight and prevent the free circulation of air. Towards the close of the year in this part of the town two latrines were erected, but the people, who never before were accustomed to use latrines, do not go to them, and the result is that the seashore, the roadside, and a plot of land in the vicinity are polluted with excreta in the same way as it was before the latrines were built. With the object of preventing the overcrowded state of Karaiur, the reclamation of about 13 acres of the sea was taken in hand some years ago, but it may take years before the work is completed.

The water supply of the town is very unsatisfactory. Water of fairly good quality can only be procured from a few wells. There are numerous other wells, but the water in them is brackish and not fit to be used for drinking.

Vaccination.

Vaccination was carried out throughout the year by seven vaccinators. The medical officers and apothecaries of the different dispensaries also vaccinated from time to time whenever subjects were procurable. The work of the vaccinators was frequently inspected by the Inspector of Vaccination and found to be satisfactory.

During the year 10,444 persons were vaccinated, 5,356 males and 5,088 females. Of these, 6,768 were operated upon by the vaccinators and 3,670 by the medical officers and apothecaries.

Of the number vaccinated by the vaccinators, 6,059 were successful, 392 unsuccessful, and 317 unknown. Of the number vaccinated by the medical officers and apothecaries, 3,178 were successful, 423 unsuccessful, and 75 unknown. The percentage of successful to total inspected was 91·89. The percentage of successful to total inspected by the vaccinators was 93·92, and by the medical officers and apothecaries 88·25. Taking into consideration that vaccination had to be suspended during the months that fever prevailed to a great extent, I think the number of subjects operated upon is satisfactory.

The preparation of calf lymph at the depôt was carried out throughout the year, with satisfactory results.

Other Observations.

The only jail in the Province is the one in the Jaffna town. In it there is accommodation for 217 prisoners. The jail hospital consists of two wards, with six beds in each. The jail was at no time overcrowded, and the largest number confined on any one day was 128.

During the year 386 persons, convicted and unconvicted, were lodged within the jail, of whom 10 were females. Three persons were placed under observation, of whom one was insane.

There were 84 admissions into the hospital during the year, but not a single death occurred. The prevailing diseases were diarrhœa and malarial fever, of which there were 43 and 16 cases respectively.

Friend-in-Need Society's Hospital, Jaffna.—In this institution were treated during the year 1,631 patients, of whom 49 died, the percentage of deaths to total treated was 3·0. The prevailing diseases were malarial fever, malarial cachexia, general debility, and injuries. At the dispensary attached to this hospital 8,056 cases were treated. The total number of visits (first and subsequent) was 5,067. The prevailing diseases were malarial fever, worms, itch, rheumatism, diarrhœa, and dysentery.

(4) SOUTHERN PROVINCE.

This Province is under the supervision of Acting Colonial Surgeon W. E. Rudd, M.B., whose report is subjoined :—

I was placed in charge of the Province on 17th March, 1902, succeeding Dr. Keith, who went on leave and retired in August.

The estimated population for the year 1901 was 561,315, for 1902 was 569,944, increase 8,629.

Year.	No. of Births.	No. of Deaths.	Birth-rate per 1,000.	Death-rate per 1,000.
1901	23,342	14,937	41·584	26·610
1902	25,686	14,544	45·2*	25·7*

* Obtained by taking average of the three districts of Southern Province.

General Health.

There were outbreaks of serious epidemic disease at five different parts during 1902 :—

(1) At Galle two cases of smallpox were reported on a steamer in February, and were treated at Bathfield House.

(2) At Hiniduma, 36 miles from Galle, 21 cases of cholera occurred, with 4 deaths, in February.

(3) At Ambalangoda, two cases of smallpox in March. Here a man with the disease in a state of delirium escaped from his house and took refuge in an ambalam, a mile or so away, where he was found. He was immediately removed into a hut in an adjacent garden, which was far more convenient for isolation than his own house ; and though the owner of the house objected to a certain degree, it is evident that in a crowded locality like this one the most convenient place must be chosen for the safety of the general public. No other cases spread from this nor from the other case.

(4) Smallpox was found in a man in the Main street, Weligama, on 14th November, twelve days after the eruption appeared. The patient was taken away 1½ mile off, and all "contacts" were put in another hut apart. Cases occurred frequently till the 2nd December ; after that no other cases occurred there. There were 13 cases, with 2 deaths, and six houses were affected, all close together. Three vaccinators were sent to work in the town and adjacent parts, and I visited Weligama twice a week to check their work by the direction of the Principal Civil Medical Officer.

(5) At Matara a girl with smallpox was found on 2nd December, who was traced from Weligama with her mother, who also unfortunately contracted the disease and died apparently from diarrhœa more than from smallpox.

The chief diseases here are malarial diseases, parangi, ulcers, dochmius duodenalis, and in some parts outbreaks of dysentery occur. Leprosy is found in most parts.

Malarial Disease.—This is the most prevalent and important disease at present, though probably the time will come when it will be less important than others. By this is meant that it can and ought to be controlled by means of some little trouble in checking it, and the only question is, What are the best plans for the purpose ?

In nearly all the resthouses of this Province is a notice of the cause of malarial fever, and doubtless it is beneficial, but the chief point of importance is to see that measures are carried out to check the breeding of mosquitoes at any spot close to a dwelling-house. Medical practitioners should be expected to inquire into the existence of breeding-places of the anopheles at the time of outbreaks or expected onsets of the disease, and patients and their friends should be always warned of the manner the disease arises and spreads. It seems possible thus to check the extensive outbreaks which occur nearly every year at certain times which correspond to the rainy season or a few weeks after the onset of the rains. Malarial fever is scarce or absent in the dry seasons, which differs slightly in the Balapitiya and Hambantota Districts.

Dysentery.—This disease, which is usually troublesome, coming in outbreaks and sometimes attacking half the inhabitants at least of a village, has not prevailed much in 1902. Only one really severe outbreak occurred at Bentota, and an officer was sent there in February, March, and April to treat the cases. The villagers prefer to be treated by their vedaralas for dysentery, and I believe the disease is thereby spread more than it need be.

The numbers reported at Bentota were :—

	Seen by Itinerating Officer.	Treated by Vedaralas.	Total.
Patients	85	146	231
Deaths	5	65	70

A smaller outbreak at Talpe shows these figures :—

	Seen by Itinerating Officer.	Treated by Vedaralas.	Total.
Patients	50	60	110
Deaths	1	8	9

Parangi is still very prevalent, and is said to be spread by the apathy or ignorance of the villagers in their mode of treating cases, the healthy and sick living in close contact, *e.g.*, if in a house with five people one person contracts the disease, at least three of the others will get the complaint from the first case, apparently without any effort to prevent this. The disease was found chiefly in the Matara and adjacent districts, and a few cases in the Baddegama and Udugama districts, but at Hiniduma only one case, and it will be interesting to see if any spread occurs.

Dochmius Duodenalis is found chiefly among Malabar coolies, but it is seen at Tangalla and Hambantota also, where the patients are mostly Sinhalese and Moors and Malays. The mortality is liable to be high because the patients will not come to be treated early in the course of the disease, and only enter hospital when the disease is in a dangerous state.

Measles is not a common disease here.

Chickenpox, a harmless disease usually, is the cause of harm very often by smallpox being mistaken for it, either through ignorance or fear on the part of the patient's friends. The idea that a case of chickenpox need not be reported to the sanitary authorities is dangerous as well as illegal, and was shown in the outbreak above-mentioned of smallpox at Weligama, when the case was supposed to be chickenpox and not reported till twelve days after the eruption had begun, and for that reason only 12 other cases contracted the disease from the first one, these being the only cases affected, with a total of 13.

Leprosy.—The new Ordinance came into operation at the beginning of 1902, and I made arrangements to inspect all lepers brought to the stations of qualified medical officers only, writing previously to the Government Agent and Assistant Government Agent about it. The plan seemed easy to carry out, but it did not work as satisfactorily as expected for these reasons :—

(1) The distance may have been too great for lepers to travel to the hospital or dispensary when willing to go.
(2) Some lepers were too ill to go.
(3) Some, I heard, refused to go.
(4) Some cases of skin disease were mistaken for leprosy, and they had a journey for nothing.
(5) Some cases disappear either before the inspection or after.

Mortality.

It is striking that the mortality in this Province is reported as not high, the diseases being many and varied, and the general health or strength of the people is not robust. Dysentery and malarial fevers are the chief causes of death.

Sanitation.

The general sanitary condition of the Province is on the whole improved, but a good deal remains to be done, especially in the outlying districts, where the people are apathetic, and headmen do not appear to insist on their attention to the surroundings. The general complaint of the medical officers is that sanitary requirements are unattended to, gardens are allowed to be overgrown with jungle, accumulations of filth allowed to exist, absence of proper wells and a good water supply, want of latrines, and the contamination of surface wells by the drainage of polluted gardens, and the want of proper burial places.

The sanitation of Galle is in the hands of the Municipality, and a special medical officer is in charge. The water supply is still of a doubtful nature. The dry-earth closet system is being extended through the Fort.

Infectious Hospital.—The Government has decided to build a temporary Infectious Diseases Hospital, which was refused for a long time, and plans have been made for three separate buildings for three diseases : smallpox, cholera, and chickenpox.

Matara is in a fairly satisfactory condition as to sanitation.

Tangalla.—The water supply is defective, being chiefly obtained from two wells near the hospital, on one side of the town. One well has pure water and the other has not, and when the water is exhausted, which happens often in times of drought, it has to be carried some miles.

Hambantota.—A water supply is required, as it is obtained now from surface wells, and is slightly brackish.

Balapitiya.—The Sanitary Board established in 1901 is making progress. A site for a cemetery and market-place was fixed on by the Government Agent and myself in April last.

Hospitals.

Government Civil Hospital, Galle.—The chief diseases treated here were malarial fever and cachexia with debility, parangi, dysentery, and diarrhœa, rheumatism, abscess, phthisis, and syphilis. The highest mortality was from malarial cachexia, diarrhœa, dysentery, and phthisis.

The following improvements were completed during the year :—New kitchen, store-rooms, two old kitchens changed into a ward, nurses' quarters had an additional room by changing the ward upstairs into a large sitting-room, new bathroom and latrine were added ; covered ways from ward No. 2 to women's ward, and from ward No. 1 to ward No. 7 (medical), also from women's ward to new ward, thus enabling any one to go round the hospital under cover ; buttresses to the outer wall with drain inside in medical officer's garden ; glass to shutters in upper verandah and window to private ward ; and a boundary wall at the back of the hospital.

Infectious Diseases Hospital.—There were 19 cases admitted here : 2 smallpox, 16 chickenpox, and 1 suspected plague, with no deaths.

Hospital for Women.—69 cases were admitted. Of these, 50 were for gonorrhœa, 2 for primary, 6 for secondary and 1 for tertiary syphilis, 10 for ulceration of vagina.

House of Observation.—42 cases were treated, of which 15 were sent to the Colombo Lunatic Asylum, 25 discharged, and 2 remained.

Jails.—The prisoners of war, who were housed in the Hambantota jail, were all sent away. The other jails are at Galle, Matara, and Tangalla. Only the Galle jail has a special medical officer, who does judicial work as well.

Matara Hospital.—The chief diseases treated are parangi, ulcers, anæmia, and malarial diseases. Mortality is mostly due to diarrhœa, malarial cachexia, debility, dysentery, and enteric.

Tangalla Hospital.—The chief diseases were malarial fever and cachexia, injuries, ulcers, parangi, worms, and skin diseases. The mortality was highest in cases of respiratory diseases, debility, and wounds ; there were 13 deaths out of 308 cases. A notable injury causing death was a bite from a crocodile, and one case of acute yellow atrophy of the liver was admitted.

Hambantota Hospital.—Malarial diseases, ulcers, injuries, skin diseases, and worms were most prevalent, and deaths were caused chiefly by dysentery and diarrhœa, malarial fever, and respiratory diseases.

Balapitiya Hospital and Dispensary.—The most prevalent diseases are worms, malarial fever and cachexia, injuries, ulcers, and skin diseases. Deaths are mostly due to diarrhœa, dochmius, dysentery, and carcinoma.

Deniyaya Hospital and Dispensary.—The chief diseases are dochmius, malarial diseases and debility, ulcers, dysentery, and syphilis. The deaths are chiefly due to dochmius and dysentery, a few from malarial cachexia, respiratory diseases, and phthisis.

Galle Harbour.—The Master Attendant, Galle, in May, wrote asking whether an inquiry could be made into the quality of the water obtained from Watering Point for the use of ships calling here, as in appearance it seemed rather doubtful. I inspected and reported on the water and reservoir, and found the water was clear and apparently pure, but the surface of the water in the tank required clearing of a green vegetable growth. The Public Analyst reported the water to be of good quality. The Acting Principal Civil Medical Officer gave directions that the water should be inspected every month and a report sent of it and the reservoir, which has been done since June last.

Disinfecting Shed.—A start was made with this in October last; a steam disinfector is used, placed in a building on the beach near the Fort. The work consists of disinfecting linen from vessels in harbour when the bill of health is foul, and destroying or trying to destroy rats in the cargo boats. No rats have been yet killed, but I found a dead lizard in one boat after disinfection, apparently suffocated. In Galle the boatmen do not live in the boats as they do in Colombo.

Vaccination.

Twelve vaccinators are employed in the Province; a female vaccinator works chiefly among the Moor women. Calf vaccination is carried on at the outdoor dispensary under the direction of the Assistant Superintendent of Vaccination, and a calf vaccinator helps in the work.

Vaccination is carried on once a week at each residential dispensary, but not at branch dispensaries, which are visited once or twice a week.

The results of the calf vaccination seem to be somewhat doubtful. Many cases of vaccination in the calf fail partly, that is, the vesicles do not seem to rise properly, which is almost worse than total failure, for the use of the calf is thus spoilt for re-vaccination. The seed lymph is sent from Madras. Recently an explanation or further account of the process of vaccination of the calves in Madras was sent to me, and I am looking forward to an improvement.

My wish and aim in vaccination is to try to have at least three-fourths of the population vaccinated, and, if smallpox breaks out anywhere, to set on as many vaccinators as necessary to vaccinate and re-vaccinate every one. This plan was tried, not without success, at the recent outbreak at Weligama and Matara. Prosecutions for offences against the vaccination laws are frequent here, and a small fine is imposed usually.

---

(5) EASTERN PROVINCE.

This Province is under the supervision of Colonial Surgeon H. A. Moraes, L.R.C.P. and L.R.C.S., whose report is subjoined :—

I have the honour to forward my report of the Eastern Province for the year 1902. I took charge on the 19th June.

Population, Births, and Deaths.

The population of the Province on the 31st December, 1902, was 177,698, which is an increase of 3,472 over that of the year 1901. The population of the Batticaloa District was 149,013, and of the Trincomalee District 28,685.

The total number of births was 7,841 and deaths 5,338. In the Batticaloa District the births were 6,754 and deaths 4,399, and in the Trincomalee District the births were 1,087 and deaths 939. The births exceeded the deaths by 2,503 : in the Batticaloa District by 2,355, and in the Trincomalee District by 148. The total number of births registered shows an increase, and the total number of deaths a decrease, on the previous year.

The birth-rate per 1,000 was 44·13, and the death-rate 30·03. The birth-rate shows an increase of 1, and the death-rate a decrease of 1·95 on the previous year. The birth-rate in the Batticaloa District was 45·32, and the death-rate 29·52. In the Trincomalee District the birth-rate was 37·89, and the death-rate 32·73.

Prevailing Diseases.

The general health of the Province was satisfactory. The diseases most prevalent were malarial fevers and their sequalæ, parangi, ulcers and other skin diseases, rheumatic affections, and diseases of the respiratory and digestive systems.

Malarial Diseases.—Malarial fever prevails more or less throughout the year, but most so during the rainy season, at the beginning of the first and the end of the last quarter. It did not prevail to the same extent as in the previous year, and did not assume an epidemic form. It was generally of the intermittent type, chiefly quotidian, though cases of the tertian type were also met with. In the hospitals and dispensaries, of all diseases treated, viz., 66,087, no less than 23,456, or a little less than a third, were cases of malarial fever. This number is, however, less by 14,342 than in the previous year. The rate per 1000 of the estimated population who were attacked with this disease was a little over 132. The largest numbers were treated at the following stations :—Eraur 6,419, Vallaichenai 4,296, Kattankudi 2,273, Batticaloa 2,210, Kalmunai 1,943, Pottuvil 1,528, and Maha-oya 1,332.

Parangi.—This disease comes next in order of prevalence. It has been reported from every station in the Province, and all nationalities of the native population are affected by it, and even some of the fairly well-to-do classes, though it is chiefly confined to the poorer classes. It is perhaps most severe in the interior or "vannam," which is chiefly inhabited by the Sinhalese, and where it has been confounded with leprosy. The disease is kept up by the bad food, bad water, and insanitary habits of the people, who appear to be quite indifferent to its prevalence. The healthy freely mix with the sick, use the same water, which is very often from the only tank in the village, for drinking and washing purposes, and in which cattle are allowed to wallow. The total number of cases treated at

the several hospitals and dispensaries was 6,370, which is 1,122 more than in the previous year. The largest numbers were treated at the following stations :—Vallaichenai 1,347, Kokkodicholai 800, Eraur 717, Maha-oya 627, Kalmunai 527, Padirippu 410, Karankoditivu 380, and Batticaloa 302.

Ulcers and other Skin Diseases.—These were reported from all the stations, and 3,348 cases of ulcers and 3,627 cases of "other skin diseases" were treated.

Rheumatic Affections were prevalent throughout the Province. 2,491 cases were reported.

Diseases of the Digestive System, the principal of which were dysentery and diarrhœa, prevailed generally, but not in an epidemic form. 1,572 cases of dysentery and 897 of diarrhœa were reported.

Diseases of the Respiratory System occurred at all the stations. 1,670 cases were reported.

Leprosy.—This disease is very prevalent in the Kalmunai district, and many cases are to be met with in Batticaloa and the adjoining villages. It appears to be spreading in the Kalmunai district, and the medical officer reports that he has met with several cases which have not been reported by the headmen. The total number reported in the Province was 142 ; of this total, 63 are in the Kalmunai district, 42 in the Batticaloa District, and 37 in the Akkaripattu district. The disease seems to be confined to the district from Batticaloa southwards. North of Batticaloa it is seldom met with, only one case having been reported from Trincomalee and three from villages a few miles north of Batticaloa. The types met with are the tubercular, anæsthetic, nervous, and mixed, and the greater majority of those examined and reported upon were of a mild form. Some of the cases reported by the headmen as leprosy on examination were found to be cases of parangi.

Relative Mortality in different Seasons.

There are practically two seasons, the wet and the dry. The wet season commences with the setting in of the rains in October and continues till December, after which the nights are dewy and chilly and the days begin to get warm. This is the season when malarial fevers and chest and bowel complaints are most prevalent, and which is the unhealthiest. The mortality is consequently higher at this time. The dry season begins in May and lasts till September, and is the healthiest time of the year.

Meteorological Conditions and their Effect on Public Health.

The climate of the Eastern Province is generally hot and dry. The monsoon rains during the latter part of the year reduce the temperature to some extent, but the public health suffers owing to the outbreak of fever. The rainfall during this period is very heavy, and the country is flooded in many parts.

Remarks on Particular Diseases.

Cholera.—The apothecary of Tampalakam reported three deaths from this disease, but the medical officer of Trincomalee, who investigated these deaths, found that they were due to other causes.

Smallpox.—No cases were reported.

Other Infectious Diseases.—A few cases of chickenpox and measles were reported from a few stations. Three cases of enteric fever were reported by the medical officer of Trincomalee, one of which proved fatal. All three were among Europeans, one being a soldier, another a sailor from one of the men-of-war, and the other an employé of the dockyard. The origin of the infection could not be traced, and the disease did not spread.

General Sanitary Condition of the Province.

The general sanitary condition of the districts is not satisfactory. Owing to the nature of the land there are large low-lying tracts, which during the rainy weather are transformed into swamps and marshes. Many large villages, such as Kattankuddi, Nindur, Karankoditivu, Eraur, Vallaichenai, Toppur, Muttur, and Kiniyai, are in a most insanitary state. The dwellings are low and dark, imperfectly ventilated, crowded together, and surrounded by a high fence, which shuts out light and fresh air. The compounds are used as open latrines, and rubbish accumulates in heaps. The drainage is very defective, and consequently during the rains there are many stagnant pools. The water in most places is obtained from tanks and shallow wells, and the one village tank is made to serve all purposes—washing, drinking, bathing, and watering cattle. Measures are being taken to improve the condition of these villages.

The sanitary condition of Batticaloa is fairly satisfactory, but much could be done to improve it. There is a Local Board of Health, but owing to want of funds improvements cannot be taken in hand. A better system of drainage is required, but owing to the nature of the land, which is flat, this is a matter of some difficulty. The compounds should be kept cleaner, and swamps and marshy grounds drained and filled up. The water supply, which is drawn from wells, is generally ample, but the wells during the dry season are apt to fail. A few public wells are provided. The water from the wells in some parts of the town is hard and brackish, but on the whole the water of the town is of fairly good quality.

Dr. Anthonisz reports as follows as regards Trincomalee :—

> The drainage and conservancy of the town still remain very defective. More money has been voted for improvements in this direction, and I hope to be able to report great improvements likely to be carried out by the Local Board of Health during the year 1903. The water supply, though ample, is not always of the best quality. The water is hard, and during the driest season most of the wells get brackish. The public wells are well looked after and protected, but those in the compounds of the native population are very liable to get contaminated. Some parts of the town are overcrowded, more especially the fishers' quarters.

As regards Kalmunai, Dr. Phillips reports that the sanitary condition is on the whole satisfactory, though there is room for improvement. The drainage of the villages is defective, owing to the land being low and surrounded by swamps and neglected paddy fields. The water supply is fairly good. The Moorish villages are overcrowded, the houses being closely packed and built without any regard to adequate ventilation.

Vaccination.

Vaccination was carried on throughout the year. The staff consists of one Inspector of Vaccination, one calf vaccinator (who also does the town vaccination), and eight vaccinators. Two Moormen and one female vaccinator carry on vaccination exclusively among the Moorish population. The work of the vaccinators was regularly inspected by the Inspector. Vaccination was also carried on by the several medical officers and apothecaries at their respective stations.

During the year 8,106 subjects were vaccinated, which is less by 80 than in the previous year. Of these, 4,066 were males and 4,040 females; and of the whole number, 79 were infants, 7,391 children, and 636 adults. Of the total number vaccinated, 6,983 were successful, 945 unsuccessful, and 178 unknown. The number of re-vaccinations was 19, all of which were successful. The number vaccinated by the vaccinators was 6,638, and at the dispensaries 1,468. The percentage of successful primary vaccinations by the vaccinators was 90·19, and at the dispensaries 79·14. The preparation of calf lymph at the depôt was carried on throughout the year, with satisfactory results.

Other Observations.

Jails.—There are two jails in the Province, one at Trincomalee and the other at Batticaloa. The former is only a lock-up. At the Batticaloa jail hospital 34 prisoners were treated, with one death from diarrhœa. The daily average in hospital was 1·40, and the percentage of deaths to total treated 3·23. The general health and sanitary condition of the jail was very satisfactory.

Hospitals and Dispensaries.—There are three Civil, one Field, and one Leper Hospitals and eighteen dispensaries, of which ten are permanent and eight visiting. A dispensary at Nadukadu was opened, and the one at Nilaveli was closed and one opened at Tiriyai in its place. All these institutions are doing good work, and are appreciated by the people. 1,653 received treatment at the several hospitals, and 64,434 at the dispensaries.

---

(6) NORTH-WESTERN AND SABARAGAMUWA PROVINCES.

These Provinces are under the supervision of Colonial Surgeon E. de Livera, M.B., C.M., whose report is subjoined:—

Population.

The population of the North-Western Province at the end of the year 1902 is estimated to be 361,373. There were 14,862 births and 10,995 deaths, giving a birth-rate of 41·12 and a death-rate of 30·39 per 1,000, as against a birth-rate of 40·78 and a death-rate of 25·43 in the previous year.

The population of the Province of Sabaragamuwa is estimated to be 327,903. There were 13,382 births and 9,347 deaths registered, and the birth- and death-rates respectively were 40·81 and 28·49 per 1,000, as against a birth-rate of 45·06 and a death-rate of 30·83 in 1901.

Prevalence of Sickness.

The general health of the districts in both the Provinces has been satisfactory. Two mild epidemics of cholera or acute diarrhœa occurred, one at Tambarawila, a village on the south-western border of the North-Western Province, close to Negombo, and the other at Ottapane, a village in the Puttalam District. A few isolated cases also occurred at Puttalam and in the Chilaw and Marawila Districts. Six cases occurred at Tambarawila, two of which proved fatal. The first person attacked was a man who had just returned from Negombo, where the disease was at the time prevalent. I visited the village on 21st April and, with the apothecary at Dankotuwa, took all the necessary measures for stamping out the outbreak. In the outbreak at Ottapane, which appears to have been a more severe one, six cases occurred, and five of them proved fatal. The outbreak lasted only from 13th to 19th March, and the prompt measures taken to prevent its spread proved successful. The infection could not have been traced to any source. Three cases, with three deaths, were reported from Wattakaliya, near Chilaw, but only one of these was seen by a medical officer. A case was reported from Irrattakulama in Marawila on 31st January. It ended in recovery, and it is doubtful whether this was a case of cholera or even acute diarrhœa. The patient had just arrived from Negombo. Another case, which ended fatally, was reported from Kattakadu, also in Marawila, on 16th March. The patient was a padda boatman, who had passed Negombo. The case was seen by the medical officer only after death. One fatal case was reported from Puttalam on 14th March, the patient dying the same day, and three cases again were reported between 28th and 30th June, and all proved fatal. The first to be attacked was an Indian cooly working in the salt pans, but several days had lapsed since his arrival from India. Two cases were reported from Battulu-oya on 3rd July, one of which proved fatal. I visited the place and helped the medical officer of Chilaw in dealing with the outbreak, but we did not succeed in tracing the source of infection. Lastly, one case of choleraic diarrhœa was admitted to the Infectious Diseases Hospital at Puttalam, and discharged after recovery on 31st October. There were in all 24 cases with 15 deaths.

Three cases of smallpox were reported from Puttalam between 22nd July and 5th August. The cases were all of a mild nature. The medical officer was not able to trace the source of infection in them.

No outbreaks of cholera or smallpox occurred in the Province of Sabaragamuwa, but 238 cases of chickenpox were reported from this Province: 4 from Karawanella, 28 from Kolonna, and 206 from twenty-nine villages in the Kegalla District.

In the North-Western Province five cases of chickenpox were reported from Dodangaslanda, and sixteen from the town of Kurunegala.

Forty-three cases of measles were reported from Rakwana, five from Pelmadulla, and five from Godakawela, in the Province of Sabaragamuwa. None were reported from the North-Western Province, though I have no doubt cases have occurred.

The diseases chiefly prevalent have been the same as in previous years, viz., malarial fever and their sequelæ, parangi, ulcers, rheumatism, diarrhœa and dysentery, anchylostomiasis, pneumonia, bronchitis, phthisis pulmonalis, syphilis, skin diseases, and worms.

Malarial Fever.—This is by far the commonest of all diseases prevalent in Ceylon. In the North-Western Province it constituted about 44 per cent. of all cases treated in the hospitals and dispensaries, and in the Province of Sabaragamuwa 36 per cent. of all the cases treated were admitted for this disease. In the year under review the number of cases of malarial fever treated was a little in excess of the number treated in the previous year, but considerably less than the number treated in 1900. Only in a portion of Wanni hatpattu, in the villages near Nikaweratiya and Galgomuwa, was it found necessary to employ an extra apothecary to itinerate in the villages and treat cases of fever, and in Kitulgalla, in the Province of Sabaragamuwa, the vaccinator was employed in distributing fever powders among the villagers. In Kegalla and Rakwana the number of fever cases treated was less than in the previous year. Fever was most prevalent during the first quarter of the year, and it is worthy of notice that during that period the rainfall was the lowest recorded during the year. This excessive prevalence of fever in the first quarter may be accounted for by the fact of the rainfall having been high two months previously, in October and November of the preceding year, causing pools and puddles to be left in which mosquitoes could breed, as explained by the Principal Civil Medical Officer in his Administration Report for 1901.

The stations in which the largest number of cases of malarial diseases were treated were the following:—Nikaweratiya (4,561), Anamaduwa (4,441), Wariyapola (4,228), Marawila (3,639), Balalla (3,359), and Polgahawela (3,104), in the North-Western Province; and Parakaduwa (4,180), Karawanella (3,655), Balangoda (2,102), and Godakawela (2,048), in the Province of Sabaragamuwa.

Parangi is chiefly prevalent in the Katugampola, Wanni, and Demala hatpattus of the North-Western Province, and in the Kolonna and Atakalan korales of the Province of Sabaragamuwa, where the inhabitants are, as a rule, poor, and subsist on kurakkan and other equally innutritious food, and depend for their water supply on small tanks, which are apt to run almost dry during certain seasons, bad water and bad food being undoubted factors in favouring the progress of the disease, causing its recurrence after it has disappeared under hospital treatment, and preventing its cure. There has been a slight decrease in the numbers treated, as compared with those treated in the previous year, as the following table giving the numbers treated in the principal centres will show:—

	Numbers treated.	
North-Western Province.	1901.	1902.
Dandugamuwa	1,173	1,292
Nikaweratiya	3,875	3,202
Anamaduwa	3,008	2,477
Balalla	1,934	1,772
Kurunegala	1,156	1,115
Province of Sabaragamuwa.		
Godakawela	592	564
Kolonna	320	611
Total ...	11,146	9,858

Diarrhœa and Dysentery.—Ten per cent. of the cases admitted into the hospitals of the Province of Sabaragamuwa and 8 per cent. of the cases admitted into the hospitals of the North-Western Province were for diarrhœa and dysentery, and these were the diseases which contributed largely to increase the mortality in hospitals. There were 460 deaths out of 798 cases of diarrhœa and dysentery treated, giving a percentage of 55 deaths, in the hospitals of the former Province; and 118 deaths out of 450 cases treated, giving a percentage of 31 deaths, in the hospitals of the latter Province. Cases occurred at all seasons, and not in one season more than in another. A slight epidemic of dysentery occurred about the third quarter of the year in some villages in the Kegalla District, and 27 cases were reported from them. The villages were visited by the apothecaries at Nelundeniya and Mawanella, and the outbreak stamped out. Five cases were reported from a village called Dimbulwela in Godakawela.

Pneumonia.—There were 74 cases of this disease, causing 27 deaths, treated in the hospitals of Sabaragamuwa, and 159 cases, causing 57 deaths, treated in the hospitals of the North-Western Province, Kurunegala alone contributing 96 cases, with 29 deaths. The cases occurred mostly during the north-east monsoon, and the medical officer of Kurunegala states that the disease assumed almost an epidemic form in November.

Tubercle.—Cases of phthisis pulmonalis were found in all the districts. 138 cases, causing 43 deaths, were treated in the hospitals of the Province of Sabaragamuwa, and 43 cases, causing 14 deaths, were treated in the hospitals of the North-Western Province. The dampness of the climate in the former may account for more cases having occurred in it.

Anchylostomiasis.—This disease is prevailing to a large extent among estate labourers and other Malabars imported from India, but Sinhalese and Moor villagers are not exempt from it. Cases of this disease were treated chiefly in the district hospitals. 145 were treated at Balangoda, 108 at Karawanella, 17 at Kegalla, and 10 at Rakwana, and 51 deaths resulted from this disease.

Remarks on Particular Diseases.

Leprosy.—Four cases of leprosy were reported from Ratnapura, 26 cases representing about 11 patients, as some cases were entered in the books more than once at different times, were treated at Balangoda; and 15 cases representing 7 patients at Karawanella; one case was reported from Godakawela, and one from Kurunegala. Some of the patients have since died, and some have left the country, and some have been sent to the Leper Asylum, and a few are living at their own abodes, isolated as far as practicable. Several of the lepers were reported from a village called Bambarabotuwa in the Ratnapura District, and the majority of the remaining ones are estate labourers who have come from the coast of India.

Cancer.—There were 13 cases of cancer treated at the Karawanella hospital, and 3 at Kegalla, and 1 case was treated at Kurunegala, and 1 at Puttalam. Three of the cases have ended in death.

Enteric Fever.—In the Province of Sabaragamuwa 2 cases were treated at Godakawela, and both ended fatally; 1 case was treated at Karawanella, which also ended fatally; and 1 case treated

at Ratnapura recovered. In the North-Western Province 1 case was treated at Kurunegala, which ended in recovery; and 2 at Puttalam, both of which died; and 4 at Marawila, of which 1 proved fatal. It is not known how these cases originated.

The following tables give a comparative statement of the numbers treated in the different hospitals of the two Provinces during 1901 and 1902 :—

North-Western Province.

Name of Hospital.	Numbers treated.		Average Daily Sick.		Number of Deaths.		Percentage of Deaths to Total treated.	
	1901.	1902.	1901.	1902.	1901.	1902.	1901.	1902.
Kurunegala	3,189	3,431	102·50	99·76	247	224	8·70	7·02

Province of Sabaragamuwa.

Name of Hospital.	Numbers treated.		Average Daily Sick.		Number of Deaths.		Percentage of Deaths to Total treated.	
	1901.	1902.	1901.	1902.	1901.	1902.	1901.	1902.
Ratnapura	1,002	771	51·63	—	154	101	15·36	13·09
Balangoda	1,293	1,602	92·59	96·66	225	129	10·46	8·05
Karawanellā	2,274	2,400	161·35	107·73	427	361	18·77	16·83
Rakwana	1,025	631	38·42	32·04	138	54	13·46	8·55
Kegalla	738	881	42·58	47·22	91	107	12·33	12·14
Kolonna	1,193	861	35·97	32·91	11	15	·92	1·74
Godakawela	637	565	27·69	22·47	22	25	4·01	4·42
Total ...	8,198	7,711	450·23	371·11	1,073	792	10·75	10·27

There were 1,951 estate labourers treated in the district hospitals, and there were 425 deaths among them, giving a percentage of 21·66 deaths to total treated.

There are 28 dispensaries and branch dispensaries in the North-Western Province, and the number of persons treated in them during 1902 was 142,915, and the number of visits paid 230,889. The amount of money collected was Rs. 3,924·03. There are 28 dispensaries, 1 branch dispensary, and 11 permanent itinerating stations in the Province of Sabaragamuwa, and the numbers treated in them were : persons 80,734, and visits 116,982. The amount collected was Rs. 1,576·28.

Meteorological Conditions.

In both the Provinces the highest rainfall was recorded in the last quarter, and the lowest rainfall in the first quarter of the year. The figures showing both the total diseases and malarial diseases treated were highest in the first quarter and lowest in the last quarter, which was the healthiest time of the year. There was a gradual decrease in the figures from the first to the last quarter. The figures indicating the rainfall, however, did not show a gradual decrease, as in the second quarter the rainfall was higher than in the first. The rainfall in the last quarter appears to have been unprecedented. In Karawanella, which may be taken to represent the Province of Sabaragamuwa, there was a rainfall of 87·21 inches during this quarter, the record for October, the wettest month, alone being 34·14 ; and in Kurunegala, which may be taken to represent the North-Western Province, there was a rainfall of 52·46 inches, the record for October being 20·27 inches. The total rainfall for the year was 215·16 inches in 1902, as against 160·45 inches in 1901, in Karawanella ; and in Kurunegala it was 110·80 inches in 1902, as against 94·96 inches in 1901. The wettest district was Kitulgala, where the total rainfall for the year was 239·67 inches.

Sanitary Condition of the Chief Towns.

Kurunegala.—Nothing has yet been done to improve the sanitary condition of this town. Steps are, however, being taken by the Local Board to provide water supply and drainage, which are its chief wants.

Puttalam.—A purer and more ample water supply is required. Swamps require filling up. The Moorish quarters are deplorably overcrowded.

Chilaw.—Sanitary condition has been much improved, but there is a good deal of overcrowding in some parts, especially in the fishers' quarters.

Marawila.—There is not much overcrowding, but the drainage is unsatisfactory.

Ratnapura.—No improvements have been made. The conservancy is insufficient, and the medical officer writes that the scavenging of the town might be considerably improved if more efficient supervision is exercised. The filter bed in the reservoir requires to be properly renewed.

Rakwana.—The drinking water of the town obtained from the polluted stream running parallel with the bazaar road, is objectionable. Two good wells and a couple of portable galvanized latrines should be provided.

Balangoda.—Supply of drinking water for the town is scanty. The whole population has to depend on a small well, which should be deepened and a pump fixed to it. Drains need much attention.

Karawanella.—Public latrines are needed at Karawanella and Ruanwella. Scavengers are also required to be employed at these places. The drains of Yatiyantota bazaar require to be properly constructed and cemented.

Kegalla.—There is no improvement in the sanitary condition. Wells, springs, and natural streams afford the source of water supply. The majority of the wells are uncovered and shallow. Drainage of the town is defective. Cement drains are required everywhere.

Vaccination.

There were 10,560 subjects vaccinated in the North-Western Province, with the following results: 8,775 successful, 598 unsuccessful, and 1,207 absent; and there were 11,781 subjects vaccinated in the Province of Sabaragamuwa, with the following results: 9,904 successful, 608 unsuccessful, and 1,269 absent. During the previous year the number of successful vaccinations was 9,237 in the North-Western Province, and 13,026 in the Province of Sabaragamuwa. The percentage of successful vaccinations in 1902 was 93·60 in the North-Western Province, and 94·21 in the Province of Sabaragamuwa. There were 33 re-vaccinations performed in the North-Western Province. Six vaccinators were employed in the North-Western Province, and eleven, including four estate vaccinators, in the Province of Sabaragamuwa, besides a female vaccinator, who worked in both the Provinces.

Jails.

There are three jails in the North-Western Province, at Kurunegala, Puttalam, and Chilaw, and two in the Province of Sabaragamuwa, at Ratnapura and Kegalla. Only short-sentenced prisoners and prisoners on remand and road defaulters were confined in these jails.

Port Duties.

The health officer at Kalpitiya inspected 163 boats. They were mostly from Jaffna, Mannar, and Negombo.

Other Observations.

The usual festival was held at St. Anna's church at Talavila in the Puttalam District in July last, where large numbers of people from all parts of the Island and from India assembled, but no outbreak of any disease occurred. Dr. A. B. Santiago was appointed to take charge of the medical and sanitary arrangements of the camp, and three assistants were placed under his orders. A temporary hospital was also put up, where 233 patients suffering from various diseases were treated. Two other medical officers were stationed on the road to the camp to inspect the gangs of pilgrims passing.

There were three new branch dispensaries opened during the year in the North-Western Province, at Hettipola, Katupota, and Rambodagala; and two new itinerating stations were established in the Province of Sabaragamuwa, at Panamura, and Tunkama.

A new ward for twenty-four beds, begun to be built in connection with the Kegalla hospital, was approaching completion at the end of the year, and a new additional female ward has been built at Rakwana.

I have inspected all the hospitals, dispensaries, and branch dispensaries (with the exception of one or two of the latter) in both the Provinces twice during the year, and some of them oftener.

---

(7) PROVINCE OF UVA.

This Province is under the supervision of Colonial Surgeon F. Oorloff, M.B., C.M., whose report is subjoined :—

Hospitals	Civil	1
	District	2
	Field or Parangi	3
Dispensaries	Civil	9
	District	9
	Estate	12
Itinerating stations		10
Estimated population	1902	186,801
	1901	186,528
Births	1902	7,968
	1901	7,433
Deaths	1902	6,982
	1901	7,574
Birth-rate per 1,000	1902	42·6
	1901	39·8
Death-rate per 1,000	1902	37·3
	1901	40·6

Prevalence of Sickness in the different Seasons of the Year.

The general health of the Province during the year was satisfactory, and no infectious disease prevailed in an epidemic form. As in the previous year, the diseases most prevalent were malarial fever, dysentery, parangi, rheumatism, and respiratory affections.

Malarial Fever.—This disease was most prevalent during the north-east monsoon. In no place did it assume an epidemic character, and the cases that occurred readily yielded to treatment. The largest number of cases, viz., 1,638, was treated in Badulla in the hospital and at the outdoor dispensary. This number, however, was 433 less than that treated during the previous year. Excluding Welimada (the dispensary at which place was opened on the 16th April, 1902), Pingarawa, as in the previous year, had the smallest number of cases, viz., 324.

Dysentery.—This disease was at its height when malarial fever was most prevalent. The villages in which it occurred were promptly visited by the apothecaries of the respective districts. There were very few deaths from it, and it never assumed an epidemic form.

Parangi.—This scourge exists to a great extent in the following places in the Province, viz., Medagama, Bintenna, Badullawella, Buttala, Muppana, Tanamalwila, and Wedikumbura. I have no doubt that with the extension of irrigation, and the consequent amelioration of the condition of the people and the improvement of sanitation, there will be few victims to it.

Rheumatism and Respiratory Diseases.—As in previous years, these diseases were mostly prevalent during the first and last quarters of the year.

Relative Mortality in the different Seasons.—The following table gives the number of deaths registered during the year :—

	No. of Deaths registered.		No. of Deaths registered.
January ...	832	August ...	483
February ...	575	September ...	687
March ...	525	October ...	621
April ...	538	November ...	648
May ...	520	December ...	573
June ...	466		
July ...	514	Total ...	6,982

The mortality, as will be seen from the above figures, began to rise in September, and reached its maximum in January. The high mortality during the last quarter and in January was coincident with the rise in malaria and dysentery during the same period. Malaria and dysentery were the two diseases that chiefly helped to swell the number of cases and the mortality. The number of deaths during the year under review was 592 less than that during the previous year.

Meteorological Conditions and their effect on the Public Health.—The rainfall was heaviest during the prevalence of the north-east monsoon. The dry season corresponds with the south-west monsoon. During the wet months the diseases which chiefly prevailed were malarial fever, dysentery, and respiratory affections, and during the dry season parangi, chickenpox, sore eyes, and skin affections.

Particular Diseases that have recurred during the Year.

Cholera.—Two cases were reported, with one death. The first case was reported from Wewelhena Estate in August. The patient died in about twenty-four hours after the attack. The information reached me after the death and the burial. From the history given by the dispenser on Wewelhena (a man who has had experience of cholera), there was nothing to indicate that the case was one of simple gastro-intestinal irritation, and I am inclined to believe that it was cholera. Although every effort was made to discover the source of infection, we were unable to obtain any clue to it. Happily, no other cases occurred on the estate. The next case occurred on Ellawatta Estate in Pingarawa. The patient was a recent arrival from India, and the history of the case certainly pointed to cholera.

Smallpox.—Not a single case of this disease occurred in the Province.

Chickenpox.—This disease was reported from seven stations. The largest number, viz., 26, were treated in the Infectious Diseases Hospital at Haputale. The patients were coolies employed at the Boer Camp, Diyatalawa.

Measles.—Twenty-nine cases were reported from three stations. Of this number, 13 cases occurred among the coolies employed at the Boer Camp, Diyatalawa, and were treated in the Infectious Diseases Hospital at Haputale.

Acute Diarrhœa.—There were 18 cases of this disease reported, of which 5 proved fatal. They occurred in Buttala, Okkampitiya, and Kataragam. The particulars ascertained pointed to the cases being those of simple gastro-intestinal irritation induced by unwholesome food.

General Sanitary Condition of the Province.

There is room for improvement in the general sanitary condition of the Province. The defects have been brought to the notice of the Government Agent.

Badulla.—The water supply is good and sufficient, the water being conveyed to the town by pipes. The drainage continues to be defective. Public latrine accommodation is deficient.

Bandarawela.—A scheme for improving the water supply is, I understand, still under consideration. The drainage is defective, in that the cross drain which connects the two side drains along the main road is not paved. This leads to stagnation of water. The scavenging was satisfactorily done.

Haputale.—The water supply is good and sufficient. The sanitation was well looked after. There is much room for improvement in the drainage. Two additional public latrines were erected during the year.

Haldummulla.—The water supply is pretty good. The drainage is bad. Public latrine accommodation is wanting.

Koslanda.—The water supply is pretty good. The drainage is bad. The sanitation was well looked after. Public latrine accommodation is wanting.

Passara.—The water supply is pretty good. The drainage is bad. The sanitation was well looked after. Public latrine accommodation is wanting.

Lunugala.—The stream which supplies the town is liable to pollution. This could be remedied by the extension of the water service from the resthouse to the bazaar street. The drainage is defective. Public latrine accommodation is wanting.

Welimada.—The water supply of the town is derived from the continuation of the Uma-oya, which rises in Nuwara Eliya, and receives in its course of about 16 miles several tributaries. Water

from tea estates and the sewage of the Nuwara Eliya hospital flow into the Uma-oya before it is diverted into the channel known as the Uma-ela at the village Perawella, which is about 10 miles from Welimada. The water of the Uma-oya is not much used by the people of Welimada for drinking. The chief source of the water for drinking purposes is a stream which flows into the resthouse premises. It is desirable that deep wells properly protected from pollution should be built in the town, and also in all the villages in Yatipalata, to at least supply the inhabitants with wholesome water for drinking. The drainage is bad.

Vaccination.

Six vaccinators (four district and two estate) were employed during the year. In addition to this the medical officers and apothecaries carried on vaccination at the outdoor dispensaries. The work of the vaccinators was regularly inspected by the Inspector of Vaccination, and the vaccination at the outdoor dispensary, Badulla, was regularly inspected by the Colonial Surgeon.

The following table shows the number of persons vaccinated and re-vaccinated, with results, during 1901 and 1902 :—

	1901.	1902.
Primary vaccination :—		
Number vaccinated	7,011 ...	6,187
Number successful	6,218 ...	5,627
Number unsuccessful	325 ...	209
Number unknown	468 ...	351
Percentage of successful to total inspected ...	95·04 ...	96·41
Re-vaccination :—		
Number vaccinated	1,014 ...	148
Number successful	471 ...	111
Number unsuccessful	291 ...	32
Number unknown	252 ...	5
Percentage of successful to total inspected ...	61·81 ...	77·62

Prosecutions under the Vaccination Ordinance.—There were 99 prosecutions, against 128 in the previous year. The results of the prosecutions were as follows :—52 convictions with fines amounting to Rs. 50·25 being inflicted, 13 acquittals, 9 cases were withdrawn, 8 cases were struck off as the accused could not be found, and 17 cases were pending at the end of the year.

---

(8) REPORT of the First Physician and Acting Surgeon in charge of the General Hospital, Colombo, Dr. H. M. Fernando, M.D., B.Sc., Lond., Fellow of University College, London.

(A) GENERAL HOSPITAL.

(1) *Administration.*

DURING the year 1902 the number of patients treated in the hospital amounted to 16,035. For purposes of comparison I append the following table :—

1897	9,063	1900	14,231
1898	9,102	1901	15,614
1899	9,399	1902	16,035

There is a steady and constant increase in the numbers receiving medical treatment. The daily average amounts to 515·09. The accommodation in the hospital provides for 467 patients only ; hence overcrowding is constant and continuous.

The temporary wards commenced in 1901 were not available for occupation till June of this year. They provide eighty-four beds for ulcer and allied cases. These wards are found to suit admirably the class of cases for which they were intended, and their opening greatly relieved the overcrowding, which was intolerable before.

The arrangement with the Home for Incurables, by which thirty-one beds are kept open for the General Hospital patients, the Government contributing to the Home funds the cost of their maintenance, continues still. But even now several beds of this hospital are permanently occupied by blind and infirm old patients, as such cases are not received by the Home. The new administration block for this hospital, a most pressing requirement for the proper conduct of its business, was again delayed this year. The plans, although completed, had to be altered in some important respects. The alterations desired necessitated a complete change of the original design, and hence the delay. The amended plans and estimates are now ready, and a start in the building will soon be made. As finally approved, this block will give a worthy and imposing frontage to this the largest and most important hospital in the Island, and, besides the necessary offices and accommodation for the out-patient department, it will provide adequate rooms in the first floor for the house officers.

The Professional Staff.—The changes consequent on the translation of Dr. T. F. Garvin as Chief Medical Officer, Prisoners of War Camp, Diyatalawa, continued throughout the year. Dr. Joseph de Silva, M.B., C.M., who was acting as the Third Physician, resigned the appointment on his taking up the duties of Assistant Sanitary Officer of the Colombo Municipality in September. Dr. J. H. Vanderwert, L.R.C.P., L.R.C.S., was appointed to act in his place.

Nursing.—The work of the Rev. Mother Superior and her staff increases with the increase of the patients. I take this opportunity to express my appreciation of the devoted and unselfish work which the Rev. Sisters so nobly perform to the great satisfaction of the suffering poor.

Expenditure.—For the diets and extras the sum expended during the year amounted to Rs. 56,413·49, for wages Rs. 10,170, for equipment Rs. 7,000, contingencies Rs. 4,320·41, and burials Rs. 530·55. The total cost per head per day for food and stimulants was 31·60 cents, as against 30·57 cents in 1901 and 30·63 cents in 1900.

Professional.—The total number of cases treated during the year reached the large total of 16,035. Of these, 1,101 died, the mortality being 6·86 per cent., as against 7·80 per cent. in 1901.

Amongst Malabars the death-rate amounted to 11·44, and amongst the cases sent in by the police in a more or less moribund condition the death-rate reached 33·87 per cent.

No special epidemic seems to have been prevalent in the district during the year under review, but dysentery, phthisis, diarrhœa, pneumonia, and enteric fever were widely prevalent. Of enteric fever 133 cases were treated, as against 198 cases in 1901. In this connection I have nothing to add to what I have said before. That no great improvement in the puolic health can be expected until the improvement of conservancy and of drainage, a more liberal policy in the distribution of water to the poorer classes, and a check to overcrowding in the slums are undertaken by the Municipality.

During the year, with the relief obtained by the opening of two new wards, I was enabled to isolate the male consumptive patients into one well-aired ward, and thus treat them more rationally and effectively. The phthisis ward is under the care of Dr. M. Sinnatamby, where he has endeavoured as circumstances permit to keep the patients in the open air as much as possible. The isolation of these patients by themselves, whilst assisting considerably their nursing and treatment, will at any rate prevent the danger of infection to others, which was such a constant menace before.

(B) PAYING WARDS.

During the year 577 patients were treated in these wards, as against 639 in 1901. These cases were distributed as follows :—

	Medical.	Surgical.
Seamen's Ward	171	153
Clerical Ward	11	5
Planters' Ward	47	89
Anthonisz' Ward	28	39
Cargill's Ward	5	3
Passengers' Ward	17	9
Total ...	279	298

Of the numbers treated, the deaths were 41, equal to a mortality of 7·11 per cent. Twenty-five cases of enteric fever received treatment, with 7 deaths.

The diminution in the number of admissions in these wards from the figures of 1901 is due entirely to a large reduction in the number of seamen. Only 324 seamen received treatment, as against 426 in 1901. On the other hand, in the Planters', Anthonisz', and Passengers' Wards there is a good increase, as 253 patients were under treatment in the year as against 213 in 1901. The diminution in the number of seamen is easily explained. In 1901 and 1902 a large number of transports engaged in the China expedition passed through the port and crowded our Seamen's Ward with soldiers suffering from enteric fever and other acute diseases. The opening of the Trans-Siberian Railway has materially diminished the admissions of Russian soldiers into this ward during the last year.

During the year a higher rate of charges was sanctioned by Government for the maintenance of patients in these wards, as the income from these wards was unequal to the expenditure incurred, and precluded the possibility of further improvements in nursing and attendance. The new scale of charges came into force on the 1st July, 1902, after due notification in the *Government Gazette*.

Revenue and Expenditure.—The total income from these wards amounted to Rs. 34,405·63. The expenditure under the head of Diets, Lighting, Attendants, and Equipment amounted to Rs. 27,032·22, leaving a balance of Rs. 7,373·41. Deducting Rs. 2,000, the cost of the nursing staff, there remains a balance of Rs. 5,373·41 only, which is far from adequate to meet the expenditure incurred by Government for the medical staff, medicines, and surgical appliances, and the cost of upkeep and repairs to buildings.

Report of Mr. H. G. Thomasz, F.R.C.S. (Edin.), Second Surgeon.

I WAS in sole charge of the surgical work in the hospital during the year 1902. The surgical work of the hospital is daily increasing. A special chloroformist is required.

Accommodation.—The ulcer, syphilis, and female surgical wards have been overcrowded during the year on good many occasions. A special ward of twelve beds for gynecological cases is much required. I have again to note that it is necessary that the hospital should be provided with isolated rooms for infectious and contagious cases, like erysipelas, tetanus, &c. A "contributing ward" of eight beds is also urgently required for those who are not absolutely paupers, but are yet unable to enter the paying wards with their prohibitive fees. A large number of people from the lower middle class prefer to enter a ward not branded as "pauper." They like to contribute something for their maintenance in hospital to secure a little extra comfort, as obtains at present in the Clerical Ward.

Equipment.—Great care is taken to secure adequate supplies of linen, furniture, &c.

Nursing.—The members of the nursing staff are very conscientious, and work hard.

Attendants are poorly paid in the pauper wards. Their work is very indifferent.

Medicines, Materials, and Surgical Dressings have been supplied in sufficient quantities, but the last requisition for surgical instruments has been cancelled. An apparatus for administering gas and a new operating table are required.

Remarks on Professional Work.—A glance at the annexed tables will show the important nature of the operation work performed in this establishment, which includes every variety of surgical work. The total number of operations performed for the year was 735. There were twelve deaths, giving a mortality of 1·63 per cent.

Of the 17 amputations, 3 were of the thigh, 2 leg, 4 arm, 1 forearm, and 7 metacarpo-phalangeal.

Sixty-one operations were performed for inguinal hernia, 18 in cases of strangulation (herniotomy), and 43 for radical cure of reducible and irreducible scrotal hernia. Bassini's and Bank's methods of operation are still adhered to by me. Only one death occurred, and that was after herniotomy; the patient was brought in too late.

Four cases of hepatic abscess with two deaths, and one case of sub-diaphragmatic abscess.

Two cases of ovariotomy were performed; one died of shock.

Forty-eight cases of hydrocele were operated on ; all did well. Extroversion of sac or tapping and injecting with perchloride of mercury solution were the methods adopted.

Twenty-one cases of hæmorrhoids internal were treated by ligature and excision, with good results.

Four cases of stone in the bladder were dealt with, one by litholapaxy and three by supra-pubic cystotomy. The bladder walls were stitched by two layers of suture and a Jacques' catheter retained for six days. All recovered.

External urethrotomy (Cock's) was performed in 18 cases for impermeable strictures and where the parts were riddled with sinuses, and Wheelhouse's operation once. Two cases of internal urethrotomy and a ruptured urethra was sutured.

Ten malignant new growths were excised and 30 non-malignant.

Two cases of laparotomy were performed : one for intestinal obstruction due to a band, which was successful ; and the other for suppurative peritonitis, which proved fatal.

Two cases of tracheotomy were performed : one in a bad case of cut throat, which recovered.

Two cases of ligature of axillary artery, and one case of ligature of common femoral artery for aneurysm. Secondary hæmorrhage set in from the site of ligature.

Trephining was done on eighteen occasions, and on three occasions for mastoid abscess.

Eight cases of thoracoplasty, with one death.

Orcheotomy was performed on 25 occasions : 19 for advanced hæmatocele and six cases for suppurative phlebitis of the cord.

Ten cases of fistula-in-ano were performed, with good results.

Five cases of lymph scrotum were treated successfully by excision.

One case of nephrotomy and median cystotomy for profuse and prolonged hæmorrhage from bladder, found subsequently to come from ureter, and one case of median cystotomy.

Eight cases of post-pharyngeal adenoids were operated on.

The kneejoint was aspirated twice, and incised and drained on three occasions.

Excision of carbuncles were performed in six cases.

Three cases of perineorrhaphy, one amputation of cervix uteri for carcinoma, seven cases of curetting of uterus, one vesico-vaginal fistula, and three cases colporrhaphy were treated. All with good results.

Sixteen amputations of penis were performed for malignant disease.

There were 23 cases of catheterization under chloroform.

One case of varicose veins was operated on with success.

Five cases of excision of breast were performed.

One case of genu vulgum was operated on with success.

Extraction of bullets and foreign bodies numbered four.

One case of harelip, with good results.

356 other operations were done under chloroform, such as excision of glands of groin, circumcision, opening abscesses and sinuses, excision of bone, cauterization for prolapsus recti, excision of elephantiasis labii, &c.

Paying Wards.—Seventy-four cases out of the 735 were from the paying wards. The more important were such as radical cure for hernia, hepatic abscess, internal hæmorrhoids, carbuncle, perineorrhaphy, colporrhaphy; nephrotomy, sequestrotomy, laparotomy, and excision of varicose veins.

List of Operations.

Total, 735 ; Paying Patients, 74 ; Deaths, 12.

Report of Dr. M. Sinnatamby, M.D. Brux., F.R.C S., Second Physician.

I HAD during the year five wards under my charge for the treatment of medical cases. The total number of cases admitted into them was 3,364, as against 3,330 in 1901. No. 1 B (phthisis ward) was opened on 1st July. Overcrowding continued unrelieved during the first half of the year, and the largest number of admissions into my wards was during the month of January, when the accommodation was taxed to the utmost limit. During the second half of the year this chronic conjested state of the wards was relieved to a certain extent by the opening of the temporary and phthisis wards.

The opening of the phthisis ward of the General Hospital is, I hope, the first step towards the realization of a long-felt want. During the year 415 cases of phthisis were treated, with 104 deaths. The percentage of deaths to total treated was therefore 25·06. Only one case was discharged apparently cured, a few improved, and the rest not improved.

Enteric Fever; Malarial Fever; Anchylostomiasis.—Please see my previous reports.

Nursing.—Please see my previous reports.

Administration.—Please see my previous reports.

Attendants.—Please see my previous reports.

Laundry.—Please see my previous reports.

Chloroforming.—This work encroaches so much on my legitimate duties that in the interest of the patients under my care some steps should be taken to relieve me of this portion of the work. I would in this connection venture to suggest that the arrangements made in the Madras hospital, having worked well, may be introduced here, at least as a tentative measure. The surgeons have or will have qualified house officers, who, like the Madras arrangement, may easily do the chloroforming to their respective surgeons, and the help the latter require during operation can easily be rendered by the senior students.

Before concluding, I must again appeal for a qualified house officer.

Report of Mr. J. A. H. Vanderwert, L.R.C.P., L.R.C.S., Acting Third Physician.

I HAVE the honour to submit my report as Acting Third Physician of the General Hospital for the year 1902. I regret that I am unable to produce a complete one, as I only assumed duties late in the year (October). The wards under my charge are the fever ward, two lower male diarrhœa wards, and the female diarrhœa ward. The number of admissions into the fever and male diarrhœa wards during the year 1902 was 2,024, and into the female diarrhœa ward 817. Of the former 314 died, and of the latter 179 deaths occurred, the rest being discharged cured or relieved.

I regret this high mortality; I believe it is not higher than previous years. I attribute it to the nature of the cases admitted into these wards. The class of patients admitted into these wards is generally of a very low order, and necessarily in a very advanced state of illness. I have noticed several deaths a few hours after admission into these wards.

The fever ward was formed in July, 1902. The cases admitted into this ward are generally enteric and pneumonia and a few sundry cases of dochmius duodenalis and rheumatism. Since July, 1902, 434 patients were admitted, and there were only 12 deaths. During the months of

October, November, and December there were four cases of enteric fever successfully treated in this ward. The five cases of pneumonia admitted into this ward were also successfully treated. The cases admitted into the lower wards were mostly those of acute diarrhœa and dysentery. Cases of tabes dorsalis, spastic paraplegia, hemiplegia, and intestinal obstruction were also noticed by me. The cases which proved most fatal were acute diarrhœa, dysentery, and advanced phthisis.

Accommodation is insufficient. Several incurables were placed in the lower wards for over eighteen months, and I am glad to state that they were transferred to the Victoria Home last December.

Sanitation.—Satisfactory.

Nursing.—The Sisters are most willing. I am of opinion that the staff ought to be slightly increased.

Report of Mr. W. H. de Silva, M.B., C.M., Ophthalmic Surgeon.

Staff.—The staff of the infirmary remains the same.

Number of Out-patients treated :—

	1901.	1902.
Eye Cases	3,797 ...	4,326
Ear Cases	383 ...	394
Throat Cases	156 ...	207
	4,336	4,927

Diseases treated during the year include :—

Albinism	1
Abscess, lid	10
Do. corneal ...	1
Do. lachrymal ...	13
Alopœcia	1
Amblyopia, tobacco ...	3
Aniridia, partial	1
Anisometropia	5
Astigmatism	9
Do. myopic ...	10
Do. hypermetropic ...	2
Do. compound ...	6
Asthenopia	3
Atrophy, optic nerve ...	20
Do. sclerotic ...	1
Burn	3
Blepharitis	8
Do. ulcerosa ...	25
Do. squamosa ...	9
Benophthalmos	1
Conical cornea	3
Cyst of caruncle	1

Paralysis, external rectus ...	2	Trachoma	24
Periostitis, orbital	1	Tarsitis	2
Presbyopia	85	Tags, dermatic	1
Panophthalmitis	7	Trichiasis	1
Pingueæla	12	Tumour on disc	1
Ptosis	3	Do. of orbit ...	2
Ptrygium	20	Zanthema conjunctiva ...	1
Psilosis (vitreous opacities) ...	3	Zanthelesma	1
Papilloma (epithehale) ...	1	Zerosis conjunctiva ...	17
Poisoned bite (eye) ...	1		
Phthisis bulba	7	Ear diseases	145
Ringworm	2	Throat diseases	67

Collections.—Rs. 124·72. These were purely voluntary.

Number of Indoor Patients.—478. There had been performed 118 major operations and 144 minor operations during the year, making a total of 262. Forty-eight cataract operations had been done, most of which were successful.

The following is a list of the more important operations performed :—

Abscess, lachrymal ...	1	Iridectomy, preliminary, for cataract	2
Do. corneal ...	1	Do. for prolapse of iris ...	2
Do. lid ...	1	Do. for occlusion of pupil...	4
Cataract	48	Needling	6
Do. dislocation of lens into anterior chamber ...	1	Orbital periostitis ...	2
		Obstruction, lachrymal ...	3
Corneal ulcer	14	Ophthalmia, purulent (scarification of conjunctiva and cauterization of cornea)	1
Cyst, dermoid	1		
Glio sarcoma of eye ...	1	Ptrygium	6
Hypertrophy of lachrymal gland...	1	Staphyloma (abscision) ...	1
Growth, cystic of conjunctiva ...	1	Strabismus	1
Cystoid degeneration of cicatrix ...	1	Sarcoma of eye	2
Enucleation	5	Do. of eye and orbit ...	1
Iridectomy for glaucoma ...	2	Trachoma	3
Do. for leucoma ...	6		

Improvements.—Owing to the possibility of the Victoria Memorial being an accomplished fact, I will not make suggestions for improvements. May I again draw the attention of the authorities to the need of a female attendant for the Eye Ward ?

---

(9) REPORT of the Acting Medical Superintendent, Lunatic Asylum, Colombo, Mr. O. Johnson, L.R.C.S.

I HAVE the honour to submit my report of the administration of the Lunatic Asylum for the year 1902.

This report, as compared with its predecessors, will naturally be devoid of much interest, as, at its best, it can only be a dry statistical record, amplifying the returns which have already been forwarded, and cannot possess the value which attaches to the opinion of an expert on the subject of Lunacy.

I assumed charge of the institution on 16th March last, relieving Dr. Spence, who had obtained a year's leave, and have thus been responsible for its administration for a period of over nine months.

Population.

Following the lines of previous reports, I will deal first with the subject of population, and in doing so will separate the Asylum proper from the House of Observation.

The number remaining at the beginning of the year in the Asylum was 463 (302 males and 161 females), the admissions during the year amounted to the large total of 165 (108 males and 57 females), thus making a total of 628 treated (410 males and 218 females). 93 patients were discharged (62 males and 31 females) and 52 died (32 males and 20 females). On the last day of the year the strength of the Asylum was 483 (316 males and 167 females), or 20 more than at the beginning of the year, the increase being pretty proportionately distributed between males and females. The daily average was 479·28, *i.e.*, 314·99 males and 164·29 females, a slight decrease on the total for the previous year, which was 481·45, but an appreciable increase in the male population, which was 305·39 in 1901.

In the House of Observation 5 males and 3 females (total 8) remained at the beginning of the year, 225 were admitted (149 males and 76 females), making a grand total of 233 treated (154 males and 79 females), 69 were transferred to the Asylum (41 males and 28 females), 150 were discharged (104 males and 46 females), 2 females died, and there remained at the end of the year a total of 12 (9 males and 3 females). The daily average for the House of Observation was 8·95 (4·67 males and 3·28 females), which was in excess of the figures for 1901 by about 1 for males and 2 for females, or 3·52 on the total.

Taking the Asylum and House of Observation together—and it is necessary to do so to correctly estimate increase or decrease as compared with previous years, as there are no two distinct buildings, and the distinction is only a technical one to serve the requirements of the law—the daily average for the year was 487·23 (319·66 males and 167·57 females). This compared with 1901 shows that, though not only was there an increase on the male side of about 10, but also an actual increase on the total of

nearly 1. This steady increase in the population, especially on the male side, where the accommodation is most limited, is a matter requiring very serious consideration, and the provision of extra accommodation cannot be much longer delayed without injury to the health of the place. It is true there has been no real overcrowding up to date, *i.e.*, the dormitories have not been occupied to the extent of precluding sufficient air space, or of being injurious to health, but the accommodation of a fairly large number of patients (no less than 94 on one occasion), however quiet and carefully selected, in the verandahs is a condition of things which cannot be contemplated with equanimity. I confess to a feeling of very great uneasiness on this account, and my anxiety has been much enhanced by an unfortunate occurrence very shortly after my assumption of duties, and to which reference will be made later on.

This question of overcrowding in the near future has engaged Dr. Spence's attention for a long time, and I find allusion made to it in several successive reports. His suggestion to convert the gate-house into wards for quiet patients, and to accommodate the displaced steward and overseers and their families in a separate new building in the grounds of the Industrial Department, at the back of the Asylum, had, when I last heard of it, reached the stage of an estimate for the necessary alterations and for the new building being submitted to Government for provision to be made in the Supply Bill of the present year; but as the works are not included in the Supply Bill, I presume no provision has been made.

As the question is one of urgency, I beg to propose, as an alternative to Dr. Spence's suggestion, and one which would cost infinitely less, the conversion of the suite of rooms occupied by my assistant into wards for European and quiet patients, a small staircase being provided at the western end of the male transept; and the occupation by the Resident Officer of the rooms lately vacated by Dr. Spence, who on his return will enter into occupation of the Superintendent's new house. I will not enter into the details of my suggestion, as I do not know whether it would appeal to Government or to Dr. Spence, but I claim for it economy, the possibility of immediate execution, as the cost would be small enough to be met from the annual vote for the maintenance of hospitals allowed to the Director of Public Works, and relief to overcrowding to the same extent as, or possibly larger than, by occupation of the gate-house. Not only was the daily average greater than in the previous year, but also the maximum strength on any one day. In 1901 the largest number accommodated was 502, and only on three days of the year, viz., 31st January and 7th and 9th April, whereas in 1902 the record of 505 was reached on four days of the same month, viz., 11th, 12th, 13th, and 16th October, and the increase was, as in the daily average, on the male side, viz., 330, as against 318 in the previous year. Between the months of July and October the strength often stood at from 500 to 504, and only once did it come down to 491. The minimum strength on any one day was rather lower than in 1901, viz., 462 on 6th March, as against 468, but the diminution was only on the female side, where, as I have stated before, the limited accommodation is not so much felt; and there actually was an increase of six on the male side.

I have been at some pains to prove the steady increase of population, and I trust the figures I have adduced will convincingly bring home to the Government the necessity for providing extra accommodation at an early date.

I subjoin a table showing the steady increase in the daily average from 1899, which should be taken along with the increase in the highest number accommodated on any one day and of the male population :—

1899	...	473·11	1901	...	486·88
1900	...	485·45	1902	...	487·23

Admissions.

The year recorded the highest number of admissions into the Asylum and into the House of Observation, 165 and 225, as against 124 and 160 respectively in 1901. Of the admissions into the Asylum, 18 were re-admissions (11 males and 7 females), and two of them (1 male and 1 female) were admitted twice in the year. Five Boer prisoners of war were received under the orders of His Excellency the Governor, 4 from the Diyatalawa Camp and 1 from Mount Lavinia.

The classification of the cases admitted was as follows :—Mania 92 (59 males and 33 females), melancholia 48 (31 males and 17 females), dementia 4 (3 males and 1 female), idiocy and imbecility 1 (female), epileptic insanity 9 (5 males and 4 females), and apparently not insane 11 (10 males and 1 female). No case presenting the characteristics of general paralysis came under my observation, although on first admission I suspected the disease in two, but after prolonged observation the absence of motor symptoms convinced me that I was mistaken.

Those cases I have returned as "apparently not insane" were chiefly criminal patients charged with minor offences, *e.g.*, "disorderly and riotous behaviour" or "trespass for an unlawful purpose," and did not either on admission or subsequently show the slightest symptoms of mental aberration. They were in due course produced before the visitors and sent back to stand their trial. I do not suggest that when the offence with which they were charged was committed they were in full possession of their faculties (and it is quite possible that at the time they were really insane and recovery had followed rapidly), but in a few cases I think, and especially in one where the charge was rather of a more serious nature, the accused had feigned successfully.

Fifty-two of the admissions were "criminals," 35, however, for technical offences, such as disorderly behaviour or trespass. The remaining cases were as follows :—Murder and manslaughter 2, aggravated assaults 3, burglary 1, cattle stealing 2, theft 8, and arson 1.

A large percentage of the cases admitted arrived at the Asylum in a very poor physical condition, and many in an extreme state of exhaustion or disease. A few of them had immediately on arrival to be taken on the sick list, and died within a few weeks. Both the deaths in the House of Observation were cases of this type.

Delusions were rather rare, and, when present, of a very monotonous type, either of being charmed or of poison administered through some secret agency. A few cases were admitted with extravagant delusions of untold wealth, superhuman strength and powers, and being of royal or noble descent. But, except in the case of a Eurasian fitter, in whose delusions electricity played an important part, the complex delusion of highly organized brains were conspicuous by their absence.

In a small proportion of cases distinct suicidal tendencies were observed, and precautions were taken accordingly. Two of them are still under careful observation, and a determined attempt at self-destruction by one was frustrated by the vigilance of the attendants.

The nationalities of the admissions were as follows:—Europeans 7, Burghers 7, Sinhalese 111, Tamils and Malabars 28, Moors 12. The Europeans include the five prisoners of war.

Discharges.

The number discharged during the year was 93 (62 males and 31 females), which was higher than that of the previous year by 10, and less than that of 1896 only. In relation to the admissions, the percentage of discharges was 56·36 (57·40 males and 54·38 females). Calculated on the total number treated, the percentage was 14·80 (males 15·12 and females 14·22), which I consider very satisfactory. The discharges are separated under the three heads "Recovered" 65 (39 males and 26 females), "Relieved" 19 (15 males and 4 females), and "Not improved" 9 (8 males and 1 female). The cases returned as "relieved" are those who, though mentally much improved, could not be recommended for unconditional discharge, and have been handed over to relatives on security being given for their proper care and custody. Without exception, those cases shown as "not improved" were the "not insane" criminal patients, who were sent back to stand their trial. Of course, the inclusion of these cases in the return as "not improved" is misleading, but as they could not have been returned under either of the other two heads it was unavoidable.

In respect of the dischage of patients of very long residence, the year, I think, has been a singular one. The difficulty in these cases is to trace relatives and friends; and to cast such patients adrift on the world, friendless and uncared for, would be cruel. I was fortunate, however, in tracing the relatives of a man who had been here for nearly twenty-three years, and handing him over safely to their care. This man is returned as "recovered," and that really had been, so far as I could test, his mental condition for some time. In two other cases of twenty-one and eighteen years, respectively, the relatives themselves came to hear of the patient's existence in quite a fortuitous manner, and removed them after giving sufficient security for their proper care. Another case of fifteen years' standing, a woman who had been adjudged insane at Kalutara, was sent to her home at Mattakkuliya, the relatives having been traced to that locality after due inquiries from the woman. One case was discharged after ten years' residence, another after eight, three after six years, one after five years, and the others after shorter periods. The shortest period of residence was twenty-four days, and a fairly large proportion was discharged within the year of admission.

Health of the Population.

The total admissions into the male and female infirmaries were 243, bowel complaints claiming the largest number, 77 for dysentery, and 53 diarrhœa. Tubercular diseases came next, with a total of 19, simple conjunctivitis contributed 9, simple continued fever 8, pneumonia 5, softening and degeneration of brain and other forms of given brain lesions 16, epilepsy 5, chickenpox 4, and smallpox 1. In the above list I have enumerated only the principal diseases. Dysentery and diarrhœa were prevalent throughout the year, and did not appear to be affected by the seasons. In March, April, June, August, October, and December, however, the largest number of dysentery cases were admitted, but not to any alarming extent or to cause anxiety, the highest number in any one month being nine.

Four cases of sporadic chickenpox occurred, and were transferred to the Infectious Diseases Hospital and returned quite recovered: two cases in February, 1 in March, and 1 in December. In all the cases it was impossible to trace the infection, and the patients were old residents, who had not been beyond the Asylum walls for a long time. Fortunately the disease did not spread. A case of modified smallpox occurred in July. The patient was an unvaccinated woman and a recent arrival from Badulla. The fever and eruption appeared within a week of her arrival, and it was thought that she had taken the infection at Badulla; but on reference to the medical officer of that station it was elicited that she had been long enough under observation at that station to preclude the possibility of having taken the infection in her village, and that Badulla had been free from the disease for years. Of course, it is possible she had taken the disease on the long journey from Badulla to Colombo, but I could get no information on this point. She was transferred to the Infectious Diseases Hospital, and returned after making a good recovery. Although this woman slept in a dormitory with a large number of patients, and was kept under observation in the Asylum for over twenty-four hours after the appearance of the eruption owing to some difficulty in diagnosis, the disease fortunately did not spread; and this was similar to the experience of the two previous years.

Deaths.

Fifty-two patients died in the Asylum (32 males and 20 females), and two females in the House of Observation, as against 74 in the previous year (38 males and 36 females). In relation to the daily average and total treated, the death-rate for the Asylum only was 10·84 and 8·28 per cent. respectively. The death-rate, though appreciably less than that of the previous year, was still high, but the large proportion of cases were incurables and old patients, whose frail existence had for a long time been bolstered up with good food and extras. Softening and degeneration of the brain and other form of brain lesions were responsible for 11 deaths, and were a contributory factor in a large number of cases returned under other causes. Phthisis and other forms of tubercular diseases accounted for 14, dysentery for 9, diarrhœa for 7, old age for 3, and was an important element in several others, debility 1, pernicious anæmia 1, chronic myelitis 1, epilepsy with gross brain lesion 3, general paralysis of insane 1, laryngitis 1, peritonitis 1, and suicide by hanging 1. One of the deaths was a Boer prisoner of war, who was transferred from Mount Lavinia suffering from acute melancholia. He contracted an attack of acute dysentery, and succumbed to it within a short time, treatment being rendered most difficult owing to his mental condition. The case of suicide occurred in April last, and was that of a Tamil woman who was admitted to the Asylum on 7th June of the previous year. Though subject to fits of excitement, and she had once climbed up a wall and leaped down, suicidal tendencies were not suspected, and for more than two months previously she had been sleeping in Dormitory No. 2. The month previous to the occurrence, a suicidal European lady having been admitted, the itinerating night watcher was detached to attend exclusively on her, and the watcher of Dormitory No. 2 was told off to perform dual duties. This

arrangement was made by Dr. Spence, and I saw no reason to disturb it, as, after my assumption of duties no dangerous or suspicious cases were admitted into the ward. On the night in question, about 10 P.M., the deceased spoke in a friendly way to the night watcher and asked for a chew of betel, just previous to the latter leaving the ward to visit the other wards. On the watcher's return about an hour later she found the woman suspended by her neck to a crossbar of one of the verandah windows. The body was at once cut down, and every effort was made to restore animation, but without success, though there was slight action of the heart when my assistant was summoned. After due investigation I held the night watcher not to blame, and her account of the occurrence was corroborated by the condition of the body when it was cut down. The usual inquest was held, and the finding of the Coroner's jury was that no one was to blame. This was the second case of suicide since the occupation of this Asylum, the first having occurred the year previously.

Expenditure.

Except in the case of diets and extras and contingencies, the expenditure has been kept within the votes. The excess expenditure was not due to any unforeseen cause, nor is it accounted for by the slight rise in the daily average. There was no increase in the contract rate for raw provisions, and my inability to keep within the vote was purely due to the fact that, notwithstanding the supplementary provision of Rs. 8,000 in the previous year, and the large increase asked for by Dr. Spence in submitting his estimate for 1902, the sum voted was exactly the same as that of 1901.

The contingent vote has for many years been exceeded, and no increased provision has been made since the introduction of gas, which at present absorbs the whole of the sum voted. Before gas was introduced in 1891 the contingent vote was Rs. 3,000, and this was the sum allowed in 1892 also, but in 1893 it was reduced to Rs. 2,000, and was gradually raised in 1897 to Rs. 2,500, at which figure it has since stood. The substitution of incandescent burners this year will, it is hoped, reduce the gas bill by at least one-half.

Diets, &c.

The raw provisions supplied by the contractor were on the whole of good quality, and it was but seldom that it was attempted to pass an inferior article. The milk supply was good, the cows being milched on the premises under the immediate supervision of one of the overseers. The scale of diets is, I think, a liberal one, and permits of variety, but for the restriction imposed by a limited vote.

Accidents and Injuries.

I am glad to be able to report no fatal accident during the year, and only one case of suicide, which I have already referred to at length. There were 3 cases of accidents, 4 of injuries inflicted by other patients, and in one case, in spite of the most careful inquiry, the manner in which the injuries were sustained was not ascertained. This was a serious case of fracture of rib, and there was no doubt in my mind that it was caused either by another patient or an attendant, but as the patient was very excited, troublesome, and incoherent, it was impossible to learn the truth. What enhanced the difficulty was that the patient occupied different wards by day and night. The most serious injury by another patient was fracture of the lower jaw. There were two fractures, the result of falls during epileptic fits, one of the right humerus and the other of the second phalanx of the right middle finger. Another patient sustained a compound fracture of the left ring finger accidentally whilst engaged in turning the wheel of the force pump. The other injuries were scalp wounds. On the whole, however, the attendants were careful and vigilant, and injuries were few and far between.

Amusements and Recreations.

The usual amusements were provided during the year: cards, bagatelle, and musical instruments. A few patients were sent to the Museum, Buddhist temples, and to witness the races at the August meet. In celebration of the King's Coronation the gate-house was decorated and illuminated, and a treat was provided, refreshments being served liberally and sports indulged in, the successful competitors receiving prizes. The annual Christmas treat was on rather a bigger scale than the Coronation one, and the Volunteer Band was in attendance. This treat is looked forward to with eagerness by many of the old patients, and appears to be very greatly appreciated. The acquisition of a powerful gramophone contributed greatly to the enjoyment of these poor unfortunates, and this machine purchased from the Industrial Fund continues to be a source of amusement and wonder. The library, which was started a few years ago, has not been availed of to any large extent. A few patients only could be induced to read or take any interest in literature. Tennis was revived during the year, and was indulged in regularly by a few. The limited extent of the grounds on the male side makes games like cricket or football impossible, but it is hoped, when the pitch at the back of the Asylum is completed, to provide outdoor games on a larger scale than at present obtains.

Building.

The buildings were kept in a good state of repair by the Public Works Department. No additions or alterations were made during the year. The new block of cells on the female side, which was completed in the course of the previous year, was occupied throughout the year, and was a valuable addition to the accommodation in that division. Relief on the male side is most required, and I have incidentally referred to the matter in my remarks on the subject of admissions into the Asylum during the year.

The Medical Superintendent's new house was occupied by me in March last, and the suite of rooms in the administration block were left unoccupied since Dr. Spence's departure.

Water Supply.

The water supply was far from satisfactory. It was my duty to bring the matter to your notice very soon after my assumption of duties; and in the belief that the deficiency of the supply was due entirely or in a very great measure to choking of the pipes, the pipes were thoroughly cleaned and relaid by the Public Works Department. But the expected improvement was not realized, and in the latter part of the year the supply was much less and more interrupted than before.

Staff.

The attendants, considering the class from which they are chosen, were on the whole satisfactory and attentive to their duties, and I think it reflects great credit on their care and vigilance that serious injuries were so few, despite the large number of troublesome and violent cases admitted.

General Remarks.

Suggestion of a Probable Cause of Lunacy in Ceylon.—In concluding this report, I desire to make a few observations of a general nature. In the majority of the admissions into the Asylum the cause of the affliction was quite obscure, and I do not in these remarks presume to offer anything like a decided opinion on the etiology of lunacy. In a very few cases only were histories available, and these were generally of so meagre and unreliable a nature as to be utterly worthless. But the comparatively large number of admissions from the Kalutara and Panadure Districts seemed to me to suggest a cause. These districts, as is well known, contain a very large number of distilleries, and are by repute the home of the arrack trade of the Island. Is lunacy in its incidence in these districts a mere coincidence, or may it not be that an intimate association exists between it and the practice of arrack drinking? In some of the cases no history of excessive drinking or drinking even in moderation was available, but my suggestion is that the disease is not due directly to the practice, but rather to a neurosis inherited from dissolute forbears.

Industrial Department.—This report would be incomplete without a reference to the Industrial Fund. The fund, the accumulated earnings of the patients, amounted at the end of the year to Rs. 18,080·03, or Rs. 815·72 in excess of the balance in hand on 31st December, 1901, which sum represented the nett earnings for the year (inclusive of interest on the sums invested in Government stock, and in fixed deposit and in current account in the Hongkong and Shanghai Bank), as against the 278·25 in the previous year. The chief source of income was the sale of vegetables to the provision contractor, which realized a sum of Rs. 1,448·50. The investments in Inscribed Stock gave Rs. 499·20, and the interest from the fixed and current accounts in the Hongkong and Shanghai Bank was Rs. 170·24, making a total gross income of Rs. 2,117·94.

The expenditure for the year was Rs. 1,302·22, and was more than covered by the profits from the garden alone. This expenditure included a monthly payment of Rs. 10 to the assistant steward for keeping the accounts of the Department, the supply of betel, tobacco, and cigars, which cost about Rs. 71 a month, the provision of two treats, one during the Coronation of the King and the other at Christmastide, and the purchase of a gramophone with twelve records at a cost of Rs. 130, besides small expenses, such as postage stamps, the purchase of a tennis net and balls, gravelling the tennis court, &c. It will thus be seen that the fund is in a sound condition, the income being in excess of the expenditure, and the capital gradually added to. It is of the greatest use to the Asylum, as being the means of providing comforts and luxuries for the patients which cannot be purchased from the annual votes to the institution, and of making their lot as happy as possible in their unfortunate circumstances.

In September last I tried to reduce the expenditure by cultivating betel, the supply of which now costs about Rs. 12 a month, but the experiment proved a failure after two months' supply. The creepers were attacked by a fungoid disease, which soon spread and caused total destruction. I append a statement showing the state of the fund at the end of the year :—

Statement of Accounts of the Industrial Department, Lunatic Asylum, 1902.

		Rs. c.	Rs. c.
Balance on December 31, 1901 :—			
Cost of 4 per cent. Inscribed Stock (Rs. 8,480)	...	8,629 85

(10) REPORT of the Medical Superintendent, Leper Asylum, Hendala, Mr. W. H. Meier.

I HAVE the honour to submit the annual report of the Leper Asylum, Hendala, for the year ending 31st December, 1902.

(1) *Statistics.*

The general statistics for the year are as follows :—

	Males.	Females.	Total.
Remained on 1st January, 1902	222	54	276
Admitted during the year	86	20	106
Total treated	308	74	382
Discharged	28	2	30
Died	30	11	41
Remained on 31st December, 1902... ...	250	61	311

The total number treated was 46 less than in the previous year. The largest number resident was 314, the lowest 261, and the daily average 225·25 males and 56·08 females. The average amount of cubic space was 1,138·65 cubic feet, the superficial area 73·70 square feet. The number of available beds was 332. The female wards were somewhat, but not inconveniently, overcrowded, as there was sufficient space in the wards to admit of a few more beds than the assigned number; the male wards were seldom fully occupied, and there was ample room for new admissions.

Admissions.—The number admitted was 106, 44 less than in the previous year; 59 were new cases and 47 re-admissions. Of the new cases, 21 were of the anæsthetic, 19 of the tubercular, and 17 of the mixed form of leprosy, the duration of the disease varying from six months to thirty years. Two doubtful cases were admitted, but under observation were found to be non-leprous, and subsequently discharged from the asylum with the sanction of the Principal Civil Medical Officer. The considerable, almost abrupt, diminution in the number of admissions, which were voluntary during previous years, was no doubt due to the Lepers' Ordinance coming into operation at the beginning of the year, and the consequent disinclination of lepers to surrender their liberty, to be separated from their families, and compulsorily detained for life in the asylum.

The new cases are distributed as follows, according to residence previous to admission into the asylum :—

Western Province. Residence.	No.
Colombo	22
Colombo District	3
Siyane Korale	3
Salpití Korale	3
Kalutara	4
Negombo	1
Hewagam Korale	1
Southern Province.	
Galle	2
Galle district	6

Central Province. Residence.	No.
Kandy	1
Province of Sabaragamuwa.	
Ratnapura	3
Province of Uva.	
Badulla	2
Haldummulla	1
Southern India	6
Mauritius	1

Discharges.—Thirty lepers were discharged from the asylum, of whom 22 absconded, 2 were discharged on leave and subsequently re-admitted, 4 Malabar lepers were at their request sent back to their homes in Southern India, 1 non-leprous patient was discharged by authority, and 1 was removed with the consent of Government for segregation in his own house, all due restrictions according to the Ordinance being observed. The absconders were reported to the Government Agents, chiefly of the Western and Southern Provinces, who had several of them arrested and sent back to the asylum in charge of the police.

Deaths.—There were 41 deaths during the year, 2 less than in the previous year, the percentage to the total number treated being 10·73, as against 10·04 in the previous year, and were due chiefly to debility and exhaustion from long-continued disease, supervention of gangrene from neglected ulcers on admission, and in three cases from tubercular phthisis acquired prior to admission.

(2) *Lepers' Ordinance of 1901.*

The Lepers' Ordinance of 1901 for the compulsory detention of lepers in the asylum on the assumption that the disease is contagious came into operation on 1st January, 1902, but, as only a short period has elapsed since its introduction, it is too soon to form an opinion as to its working and its effect on the leper population of the Colony. Only a few cases were compulsorily admitted, being sent in from the Provinces by the Government Agents, but the majority have sought admission voluntarily, and were admitted, after examination, with a ticket of admission from the Principal Civil Medical Officer. The Ordinance has not as yet been strictly enforced, as there are still many lepers in their homes who have not been reported and sent into the asylum. The asylum is not in a position at present to receive a large number of admissions, accommodation being insufficient for the purpose. The proposed additions—three new wards with fifty beds each—are still under consideration of Government, the estimates for which have not yet been sanctioned. Separate and suitable buildings are also required for accommodating the better classes of patients who come under the Ordinance, for whom paying wards should be established.

(3) *Administration.*

There were no additions to the staff of the asylum. Mr. Ederesinghe, the apothecary, was transferred to another station, his post being filled up by the appointment of Mr. Nanayakkara, who took up his duties on 11th June. An increase of coolies and a gatekeeper, to act also as a watcher, is urgently needed to prevent intercommunication between the inmates and the neighbouring villagers.

(4) *Water Supply, Dietary, and Sanitation.*

The water supply has, as hitherto, been ample and good; the dietary, both as regards quantity and quality, satisfactory; and the sanitary condition of the asylum has, as usual, been fully maintained during the year.

(5) *Outdoor Dispensary.*

2,109 out-patients were treated during the year, as against 1,487 in the previous year, the increase being due chiefly to the prevalence of malarial fever in the outlying districts and the general prevalence of worm affections among the children in the neighbouring villages, 454 cases of the former and 509 of the latter having been treated at the dispensary. The months of January, February, April, May, June, and August show the largest number of malarious fever treated, but there was no general outbreak of the disease in an epidemic form in the district during the year. Other diseases treated were rheumatic affections, anæmia, diseases of the respiratory and digestive stystems, and skin diseases. The collections, amounting to Rs. 638·17, were deposited in the Colombo Kachcheri.

(6) *Garden Fund.*

The receipts from garden produce, Government allowance, and expenditure on betel, &c., during the year were as follows :—

		Rs. c.
Receipts from garden		1,142 99
Government allowance		770 11
Total ...		1,913 10
Expenditure on betel, &c.		1,579 54½
Balance ...		333 55½

(11) REPORT of the Port Surgeon, Mr. H A. Keegel, L.R.C.P. Edin.

I HAVE the honour to submit my report for the year 1902. The year has been a most satisfactory one as regards the immunity of the port from infectious diseases. The restrictions as regards plague and its prevention were unaltered, and strictly carried out. Only one case of plague was reported at this port during the year, and that a mild one in a state of convalescence. The patient, a lad in the employ of the M. M. Company on board the ss. Polynesien, evidently derived the infection at Hongkong, and was attacked with the disease immediately after the ship left Singapore. The glands affected were those of the axilla and neck, and the patient was on arrival at Colombo in a state of convalescence. The vessel was placed in strict quarantine, and took in coals, water, and stores by means of her own crew and left for Galle, where the patient and a party of Chinese passengers for Ceylon were landed. The vessel then proceeded on her voyage to Europe.

The ports of Calcutta, Bombay, Kurachee, Mangalore, Mauritius, and Hongkong remained foul throughout the year. The plague was prevalent for a considerable part of the year at Sydney. Linen from steamers arriving from all these ports landed here for washing was in every instance disinfected at Kochchikada. All native passengers from infected areas arriving here had their persons and belongings disinfected before they were allowed on shore. European passengers under ten days from infected areas landed on bonds and after disinfection of soiled linen, but all native passengers arriving here before the expiry of their quarantine period, excepting those specially exempted, were either placed on the hulk in harbour, if over eight days, or otherwise sent to Ragama to complete quarantine.

Disinfection.—The two Thresh's steam disinfectors at Kochchikada worked very satisfactorily throughout the year. The total earnings amounted to Rs. 5,840·80, as against Rs. 2,422·50 during 1901. The total number of persons, including passengers, coolies, and tally clerks, who underwent personal disinfection at the Kochchikada station was 26,095, made up as follows :—

Cargo coolies		21,103
Tally clerks		2,216
Passengers		2,776
Total ...		26,095

and the number of cradles of soiled linen passed through the disinfectors was 4,804½, as against 948 in 1901. There was during 1902 a reduction in the rate charged per cradle to Re. 1·25 from Rs. 2·50 for less than thirty cradles; and a half rate of 62½ cents per cradle, if over thirty cradles be disinfected from the same ship. The disinfecting station is suitable, and no additional accommodation seems at present necessary.

Quarantine Hulk.—The immigration barque "Sultan Secundra" was for a great part of the year at my disposal for the purpose of quarantine, except when occasionally required for other public purposes. The persons placed on this ship were all natives under ten days from plague-infected areas, and having less than three days to complete their period of observation. The majority of these were relief crews awaiting the arrival of the ships for which they were intended. The arrangement was most convenient, and obviated the conveyance of large parties of men and enormous quantities of luggage by railway to Ragama for a couple of days. All persons having more than three days to put in were sent to Ragama.

European passengers and others specially allowed to land by the Chairman of the Plague Committee on bonds under ten days from an infected area, as a rule, submitted to the restrictions and conditions imposed without any apparent hardship to themselves. A few cases where neglect was evident were prosecuted for breach of the regulations, and fines varying from Rs. 20 to Rs. 75 were imposed.

Scarlet Fever.—This disease was reported from three vessels during the year, viz., the "Ormuz" on the 28th May, the "Congella" (two cases) on the 6th October, and the "Ophir" on the 30th October. Strict quarantine was imposed in every instance, and the mails and saloon passengers only were landed, the latter on the usual bonds and after disinfection. Coals, cargo, and stones were taken on board by the ships' crews, and no communication was allowed with them.

Cholera prevailed in South India epidemically from time to time, and all deck passengers arriving here during such times certified to have come from cholera-infected areas underwent a quarantine of five days. Only six cases occurred in port. Of these, only two were landed and

removed to hospital, where they were admitted as cases of acute diarrhœa. The rest proved fatal. One was buried ashore, having died at the cooly depôt, and the others were taken out to sea and dumped by the vessel in which they arrived.

Smallpox.—Two cases of a confluent type were landed here, one from the ss. Howick Hall from Calcutta, the patient being the chief officer of the ship. The case proved fatal. The other case was from the French mail steamer from Marseilles (ss. Ville de la Ciôtat). The patient recovered.

Eight cases of chickenpox and six cases of measles were sent to the Infectious Diseases Hospital during the year.

Bills of Health.—The following is a summary of the revenue from this source :—

Outstanding at end of 1901			8
Issued during the year			1,453
	Total ...		1,461
Deduct *free* bills	85		
Outstanding at end of 1902	3		
		88	
	Balance ...		1,373

At Rs. 10·50 each = Rs. 14,416·50.

This sum went to the credit of Government. The amount collected during 1901 was Rs. 13,597·50.

Vaccination was carried on throughout the year at the cooly depôt. All Tamil labourers other than estate coolies arriving by the steamers from Tuticorin and Ammapatan who bore no satisfactory marks of vaccination were vaccinated before they were allowed to go away. 7,712 persons were operated on, but no results can, under the circumstances, be expected to be recorded.

General.—No change took place in the *personnel* of the staff during the year. I desire to record my satisfaction of the manner in which the Assistant Port Surgeons did their work; I also received much assistance from the Police, and found I could always rely upon the co-operation of the various steamer agents in carrying out the regulations.

---

(12) REPORT of the Registrar, Ceylon Medical College, Dr. A. J. Chalmers, F.R.C.S. London.

THIS year has been one of rapid progress, and if 1903 show as much progress the College will be a small but properly equipped medical school in 1904 or 1905.

All the students of the College are now properly registered in England, and all have proper certificates for the classes which they have attended in the College.

Certificates as an apothecary of the Ceylon Medical College have now been issued to all persons who, having passed the Final Apothecaries' Examination, made application for them.

President of the College.—For a long time the Medical College has been without a President, and I think that the most important event of 1902 with regard to the College is the gracious act of His Excellency the Governor Sir West Ridgeway, G.C.M.G., K.C.B., K.C.S.I., in consenting to become the President of the College.

The Council.—Early in 1902 an appeal was made to the Government to grant a Charter to the College, and a reply was received that as soon as the College was placed upon a proper footing with regard to teaching, apparatus, and laboratories, application for this Charter was to be made again. Application will therefore be made in 1903.

Lectures.—The first improvement was the appointment of Mr. S. C. Paul, M.B. (Madras), F.R.C.S. (England), as lecturer on Anatomy. He is the first lecturer to be appointed who devotes his time to teaching in the College. Under his care the students have begun to study practical anatomy systematically, and I feel sure the benefit of this will be seen in time to come. Personally, I cannot speak too highly of the great help and assistance which I have received during the past year from Dr. Paul in all matters connected with the College.

The next appointment was that of Mr. A. Willey, D.Sc. (London), F.R.S., to be lecturer on Biology. It needs no words of mine to draw attention to the great benefit which the College has derived from having so distinguished a scientist as Dr. Willey associated with its work. The great and increasing importance of animals and plants as a cause and a means of spreading disease necessitates a good and practical knowledge of biology by the students.

This year the Government has voted the necessary money for the following new lecturers :—

Professor of Pathology and Bacteriology.—This gentleman will, it is hoped, be obtained from Europe, and will be a trained Pathologist, and will devote his whole time to his duties.

Lecturer on Clinical Medicine.	Lecturer on Practical Pharmacy.
Lecturer on Clinical Surgery.	Lecturer on Hospital Forms.

The new lecturers will be appointed early in 1903. The lecturer on hospital forms was appointed in April, 1902, without remuneration, but in 1903 will receive remuneration.

The teaching of practical pharmacy has been neglected up to the present, but it is hoped that in future this will be altered.

Lecturer on Dietetics.—With great kindness Dr. Sinnatamby consented to give a course of lectures on dietetics without remuneration.

Lecturer on Skiagraphy.—Dr. Attygalle kindly undertook to give some lectures in skiagraphy without remuneration.

Demonstrators.—Demonstrators in biology and anatomy have been appointed. A new Assistant for Biology, &c., has been appointed, and a librarian for the Students' Library.

Buildings.—Great changes have been effected in the buildings, which were merely lecture halls, and which have been converted into one large lecture hall, fitted at private expense with punkahs and incandescent lamp.

Laboratories: Physiological, Biological, Chemical.—The Physiological Laboratory was formed from an open recreation room called the Paulusz Hall, and is well fitted as a Physiological Laboratory,

and is called the Paulusz Physiological Laboratory. The Biological and Chemical Laboratories have been formed from lecture halls fitted with gas, benches, and lockers. A good photographic room has been made from a small empty room. A new building has been erected for pathological and anatomical work.

A porch has been erected privately over one of the doors of the College, and another porch over another door has been promised by the British Medical Association and the Colonial Medical Library. The exterior of the College has been lighted by incandescent gas privately.

A large number of trees have been cleared from the front of the College, thus making it easily seen from the road and preventing damage to the roofs of the College.

Apparatus.—A large indent for apparatus for chemistry, biology, anatomy, physiology, pathology, materia medica, midwifery, surgery, ophthalmology, and hygiene has been sent to England, and will, it is hoped, be received early in 1903.

A certain quantity of biology, chemical, physiological, and pathological apparatus have been received during the year. All this apparatus is required to render the teaching more practical.

Old surgical instruments returned from the hospitals have been converted into the nucleus of a collection of surgical instruments.

Diagrams.—A number of diagrams to illustrate lectures have been made during the year, and it is hoped that in time every course of lectures will be well illustrated by diagrams.

Books for the Library.—A large quantity of books for the Students' Library have been received, and have yet to be received.

A number of anatomical plates have been framed and hung round the Students' Library.

Requirements.—A building, plans of which have been made by the Public Works Department, is urgently required containing a—

Lecture room	Students's lavatory
Chemical laboratory	Anatomical, Materia Medica, and Hygiene Museum
Physical laboratory	
Students' common room	

The present chemical room is very small, and is used for—

Chemistry	Physiological Chemistry
Physics	Pathological Chemistry
Medical Jurisprudence	Practical Pharmacy

Work of the College: Students.—At the end of the year there were 87 medical and 37 apothecary students in the College; total 124.

Fees.—The total fees for the year were about Rs. 16,000.

Prize Examinations.—The medals in anatomy, physics, materia medica, and medical jurisprudence were awarded.

Examinations.—Twenty candidates passed the Medical Preliminary Examination; Mr. E. C. Spaar obtained the Government Scholarship.

12 passed the First Professional in May	5 passed the Second Professional in July
12 passed the First Professional in July	6 Third Professional, Part I, in May
3 passed the Second Professional in May	1 Third Professional, Part I, in July.

---

(13) REPORT of the Medical Officer in charge of the Lady Havelock Hospital, Mrs. M. N. Fysh, M.B., London.

I HAVE the honour to submit my annual report for 1902.

The total number of patients treated was again larger than in any previous year, being 1,072, compared with 1,030 last year. This was in spite of the enforced idleness of one or other of the wards for many weeks in the spring, owing to repairs and re-cementing the floors. The children among the patients numbered 320, compared with 256 in 1901, 191 being girls and 129 boys. The number of Mohammedan women keeps about the same, 48 being treated this year against 49 last year. The number of cases of diseases peculiar to women was 124. There were 22 cases of enteric fever, with 8 deaths, giving a death-rate of 36·3 per cent. There was just double the number of cases, and approximately the death-rate was doubled, as compared with last year. In the first eight months of the year 12 cases were admitted, with 2 deaths only, while from September to December 10 cases occurred, with 6 deaths, all being of a severe type, 3 with meningitis.

Of dysentery, there were 24 cases, with 7 deaths, the rate being lower than that of typhoid, though higher than last year, 29 per cent.

The number of operations under chloroform was 40, with 1 death. This was in a case of malignant disease of the cervix uteri. The recoveries include 2 cases of ovariotomy for very large cysts, one being in a woman of great age, whose descendants number 42, four being great grandchildren. This old woman, though she nearly died on the table, and only recovered after artificial respiration had been carried on for ten minutes, made a remarkably rapid and complete recovery. She left the hospital seventeen days after the operation, and has since enjoyed perfect health and vigour. The other ovariotomy was also of interest, as it was done during pregnancy (two months), which continued uninterruptedly after the operation, until in the sixth month the patient rashly made a rough and tedious journey, which brought on a premature labour. She is now in the best of health.

The Nursing Staff and Training School.—This year has been a very difficult one for the nursing staff, as so many changes have unavoidably taken place, and during most of the year the staff has been very shorthanded.

In April an examination was held, when two nurses obtained certificates, and two months later were sent on to outstations.

On 8th July Miss Wollen left for England on three months' leave, and to my very great regret resigned her appointment in October owing to ill-health.

Four nurses came for short periods, but were found unsuitable,

I very much regret to say that pupil nurse Jenkins was attacked with typhoid fever in August, and died with symptoms of meningitis on 9th September. She was a promising young nurse, and her death was a loss to the nursing staff.

Branch Hospital.—The total number of patients treated here was 238, being 60 less than last year. One death occurred. Several patients were sent on when cured to the Salvation Army Rescue Home, where some of them have done well. I have set aside one ward for married and respectable patients, and a good many have taken advantage of the arrangement who would not otherwise have stayed in this hospital for treatment.

Outdoor Dispensary for Women and Children.—The number of patients here was 15,678, being 829 fewer than last year. A great number of the out-patients come from considerable distances, *e.g.*, from Negombo, Mount Lavinia and beyond, Matara, Henaratgoda and beyond, and a few from remoter parts of the Island. The number of children was 3,448, as compared with 2,253 in 1901, so this department has increased. The number of boys seen was 1,463, compared with 872 last year. The number of patients treated for worms forms a large proportion of the whole, being 2,683, or about one in five. I find that almost every case of anæmia is directly traceable to this cause. The other ailments treated were chiefly troubles due to pregnancy and the peurperism, uterine displacements, chronic constipation, scabies, malarial fevers, and rheumatic pains. Not one case of chorea has occurred here during the last three years among over 50,000 patients, and only two of rickets. In fact, most of the diseases which are very commonly seen in England seem to be rare in Colombo. Those troubles which occur in common, moreover, run a more acute and rapid course in this country. I would instance pulmonary phthisis, of which I have not yet seen a chronic case with cavities in Ceylon. This seems strange, as the disease is so comparatively common ; 20 cases were seen here last year, 10 cases of cancer, and 11 of leprosy.

REPORT of the Medical Superintendent of the De Soysa Lying-in Home,
Dr. M. Sinnatamby, M.D. Brux., F.R.C.S.

I HAVE the honour to submit my annual report of the above institution for the year 1902.

The total number of patients treated during the year was 737, as against 499 in 1901 and 162 in 1890. Of the total number treated, 695 were discharged cured, 2 removed by relatives, and 4 transferred to the General Hospital relieved, 9 died, and 16 were remaining at the end of the year. The percentage of deaths to total treated was 1·25. Of the 9 deaths recorded, 2 were due to diarrhœa, 1 to dysentery 2 to eclampsia, 2 to exhaustion from protracted labour, 1 to anchylostomiasis, and 1 to cerebral hæmorrhage. Of the 12 cases of puerperal eclampsia admitted, 2 proved fatal, giving a percentage of 16·66. Of these two deaths, one was admitted in a moribund condition (patient dying in about an hour after admission), and the other died not of eclampsia, but of œdima of the lungs, which supervened on the fourth day after admission. I am able to record good results again on the thyroid treatment of puerperal eclampsia.

After the appearance of my paper in the *Indian Medical Gazette* I am glad to observe that some of the maternity hospitals in India have adopted the treatment introduced by me with gratifying results. I have again to draw the attention of the profession that anchylostomiasis is a very serious complication of pregnancy.

Ten cases of placenta prævia were admitted during the year, without any fatal results. Of the 718 admissions, 709 were admitted before delivery and 9 after delivery. Only 20 were admitted before commencement of labour.

Subjoined I give in tabular form the various classifications of obstetric cases :—

Table I.—Classification of Obstetric Cases.

Class.	Division.	Subdivision.	Admitted.	
Natural	Purely natural	Occipito anterior	478	
	Variety	Occipito posterior	16	
				494
Difficult	Tedious	Natural powers, over 24 hours	2

Spurious ...	... ...	...	50
		Total ...	737

Of the 178 operations performed, the 2 cases of symphyseotomy require special mention.

The admissions have more than quadrupled within the last ten years; the increase from 499 in 1901 to 737 in 1902 is a material one (nearly 47 per cent.). The popularity of the institution can be gauged by the number of Mohammedan patients admitted during the year. This has increased from 8 in 1901 to 20 in 1902.

The Lying-in-Home, as a training institution, is doing excellent work. The European method of conducting labour, which has been denied hitherto to the poor villagers, will gradually be introduced by the approval and adoption of my proposal for admission of native pupil midwives from villages of various Provinces. To ensure a thorough success great care and forethought are necessary in the selection of fit candidates, and this can only be effected by the co-operation of the medical officers and Government Agents of the various districts. The number of native pupil midwives has been increased from four to six from the commencement of 1902. There are over 100 candidates registered for admission as pupil midwives from various Provinces. I would therefore beg to submit in this connection that the number may be further increased to eight. Government sanctioned four pupil midwives at a time when admission into this institution was barely a hundred. The admissions have since increased by almost seven-fold. As there are no ward attendants, this increase to eight pupils to meet the growing popularity of the institution is an absolute necessity, apart from the point of view of speedily introducing European midwifery practice into villages.

This institution also trains midwives, who generally belong to the European or Burgher community, on payment of fees, as their usefulness is generally restricted to the well-to-do class of people in towns, *vide* table below :—

Table VI.

	Remained from 1901.	Admitted during 1902.	Passed in 1902.	Out of those passed.

Stipend pupils ...	4	7	8	7	1	—	—
Total ...	8	14	13	8	1	2	2

Equipments.—*Vide* my report for 1901.

Staff requires to be increased by an assistant matron and a permanent dispenser. *Vide* my report for 1901.

Accommodation has been increased by the construction of a new ward for septic cases and an operating room.

To prevent overcrowding it will be necessary to occupy the entrance block, which will necessitate building of quarters to the matron and an administration block. The labour wards also require to be increased by four rooms.

I cannot close this report without bearing testimony to the efficient work done by the matron.

---

(15) REPORT of the Acting Director, De Soysa Bacteriological Institute, Dr. S. C. Paul, M.B. Madras, F.R.C.S., England.

THE work of this institution was carried on for the greater part of the year by Mr. Joseph de Silva, M.B., D.P.H. I took charge of the work from the 15th September. Dr. Van Houtun, the Boer prisoner of war, continued to work in the institute till August of this year, when on the declaration of peace he returned to Holland. He completed his researches on the bacillus which he isolated from leper cases and successfully cultivated in a mixture of fish and peptone broth. The results of his researches are embodied in a paper contributed by him to the Journal of Pathology and Bacteriology (No. 3, vol. VIII.). The bacillus that he has isolated differs both in size and staining properties from Hansen's leper bacillus. He has observed the Pfeiffer-Bordet reaction in vitro by mixing leper serum with broth cultures of the bacilli in dilutions of 1 in 100. His researches, however, cannot be regarded as complete. Further investigation is necessary either to establish the identity of this bacillus with Hansen's bacillus, the differences at present observed being probably due to the variations in the nature of the media, or, if they are different, to ascertain which of the two is the causative agent in leprosy. The Pfeiffer-Bordet reaction does not establish this point, as this reaction may be given if Van Houtun's bacillus is constantly present in association with Hansen's bacillus in leper cases.

The routine work of the institute consisted chiefly in the testing of blood for Widal's reaction and sputum for tubercle bacilli. The great bulk of the work was undertaken for the Government Civil Hospital of Colombo. Since the 17th January a small fee was charged for examining and reporting on specimens sent by Municipalities, Local Boards, and private practitioners. No fee was charged for work done for the various Government institutions and the Military Department. The total number of specimens examined during the year amounted to 923, as compared to 287 in 1901, an increase of 636 for the year. Appended below is a tabulated list of the specimens examined :—

Blood for Widal's reaction	488
Blood for streptococci	4
Blood for malarial parasites	19
Blood for plague bacillus	2
Bacteriological examination of vaccine lymph	7
Bacteriological analysis of water	4
Contents of stomach for sarcinæ	1
Contents of intestines for cholera vibrios	23
Membrane for diphtheria bacillus...	2
Milk for typhoid bacillus	1
Nasal secretion for leper bacillus	6
Saliva for plague bacillus	1
Soil for typhoid bacillus	1
Sputum for tubercle bacillus	357
Urethral discharge for gonococci	6
Urinary deposits	1

Of the 488 cases examined for Widal's reaction, a positive result was obtained in 215 cases. In the majority of these cases the reaction was obtained during the second week of the fever. In a few cases the reaction was not obtained till the fourth week of the fever. I am sorry to state that there has been a falling off in the number of specimens sent by private practitioners for Widal's reaction ever since the prosecution of some of the medical men of Colombo by the Colombo Municipality for not reporting cases of enteric fever.

Although twenty-three specimens were carefully examined for cholera vibrios, a negative result was obtained in all the cases. These specimens were all forwarded from cases presenting the clinical signs of cholera. A large variety of organisms were found to be present. Further investigation is necessary to determine the specific organism. The symptoms may be due to toxic material produced by the large variety of organisms present, in which case a specific bacterium may not exist.

The following list shows the number of specimens received from the various institutions :—

Government Civil Hospital, Colombo	532
Lady Havelock Hospital	95
Borella Convict Hospital	101
Military Department	26
Police Hospital, Colombo	33
Boer Camps	25
Outstation Hospitals	4
Private Practitioners	100
Vaccine Department	7

The fees received during the year amounted to Rs. 380 ; of this, the Government has waived Rs. 79·50 ; Rs. 298 was deposited in the Bank of Madras on Government account ; Rs. 2·50 is still in arrears. If the work done for the Military and the Boer Camps was charged for, the institute would have realized another Rs. 258·50.

Mr. Arthur C. de Silva, my Assistant, has done good work during the year. He has acquired the necessary skill in bacteriological technique. In view of the special nature of the work, I would recommend that he should be put on the same footing as the Assistant to the Lecturer on Physiology at the Ceylon Medical College.

---

(16) REPORT of the Chief Medical Officer, Prisoners of War Camp at Diyatalawa, Mr. T. F. Garvin, M.B., C.M.

1.—GENERAL.

(*a*) *Strength.*

ON the 31st December, 1901, the number of prisoners of war in the camp at Diyatalawa was 4,006. There were no fresh arrivals since. The strength of the camp at the end of each month and the daily averages were as follows :—

Month.	Strength at end of each Month.	Daily Average for the Month.
January	4,036 ...	4,014
February	3,961 ...	3,985
March	3,993 ...	3,973
April	3,963 ...	3,962
May	3,966 ...	3,961
June	3,980 ...	3,964
July	3,603 ...	3,818
August	3,197 ...	3,448
September	3,192 ...	3,192
October	2,658 ...	2,979
November	2,695 ...	2,712
December	20 ...	1,074

(*b*) *Climate and Meteorology.*

The following is a summary of the meteorological observations of most interest made during the year:—

Month.	Adopted Mean Temperature of Air for Month.	Highest Maximum in Shade.	Mean Maximum in Shade.	Lowest Minimum in Air.	Mean Minimum in Air.	Mean Degree of Humidity (Saturation = 100).	Rainfall.	Average Sunshine per Day.	Mean Amount of Cloud. 0—10
	°	°	°	°	°	°	In.	Hours.	
January	66	77·8	72·9	49	55·5	68	8·83	8.3	4
February	68·1	79·2	75·4	50·8	57·5	65	1·22	8·6	4·5
March	71·2	83	79·2	49·8	57·5	60	1·82	9·2	4·5
April	71·6	83	79·4	55·4	60·8	70	7·80	7·2	6
May	73·4	85·2	81·1	59	61·6	68	4·87	8·2	4·5
June	73·2	85·2	80·5	57·8	61	62	3·90	9·5	3·5
July	72·5	83·2	79·2	54	61·4	55	0·84	9·6	4·5
August	72·3	84	79·6	59	61·4	63	3·95	8	4·5
September	71·8	83·2	79·6	56	61·1	63	3·96	7·5	5·7
October	69	79	75·6	56·5	60·6	76	20·23	5·6	6·5
November	68·3	79	75·1	58	60·7	78	14·33	5·6	7·4
December	65·6	78	74·1	54	59·1	80	6·20	6·3	6
For the year 1902 ...	70·2	85·2	77·6	49	59·8	67	77·95	7·8	5·1

(c) *Sick Rate.*

The total number of sick treated in the various hospitals in the camp during 1902 was 718. Of this number, 48 remained over on the 31st December, 1901, and 670 were new admissions during 1902.

The following table shows the average strength of the camp from month to month, the numbers admitted to hospital, and the ratio of sick to the average strength per 1,000 :—

Month.	Average Strength of Camp.	No. of all Cases admitted to Hospital.	Ratio of all Sick to Average Strength per 1,000.
January ...	4.014	46	11·46
February ...	3,985	48	12·04
March ...	3,973	52	13·09
April ...	3,962	51	12·87
May ...	3,961	66	16·66
June ...	3,964	60	15·13
July ...	3,816	69	18·08
August ...	3,448	77	22·30
September ...	3,192	67	20·99
October ...	2,979	61	20·47
November ...	2,712	55	20·29
December ...	1,074	18	16·75
For the year ...	3,423	670	196

(d) *Mortality Rate.*

The total number of deaths during 1902 was 26. Of these, 6 resulted from enteric, 9 from dysentery, and 11 from all other diseases.

The following table shows the ratio of all deaths to the average strength of the camp per 1,000 :—

Month.	Average Strength of Camp.	No. of Deaths from all Causes.	Ratio of all Deaths to Average Strength per 1,000.
January ...	4,014	—	—
February ...	3,985	—	—
March ...	3,973	1	—
April ...	3,962	1	0·25
May ...	3,961	1	0·25
June ...	3,964	3	0·75
July ...	3,816	5	1·47
August ...	3,448	4	1·16
September ...	3,192	2	0·62
October ...	2,979	2	0·67
November ...	2,712	4	1·47
December ...	1,074	3	2·79

Taking 3,423 as the daily average strength for the whole year, the mortality rate is 7·59 per 1,000.

2.—MEDICAL.

(1) *Staff.*

Professional.—The professional staff was reduced during the year by the transference of Assistant Medical Officer H. Leembruggen, L.M.S. (Ceylon), to Urugasmanhandiya Camp in January. At the end of the year Mr. Prins, L.M.S. (Ceylon), was transferred to Mount Lavinia, and Mr. Keyt, L.M.S. (Ceylon), was seconded for service as Civil Surgeon under the Military at Diyatalawa.

Nursing.—Nurses Von Dadelszen and Nell were discontinued at the end of November. The prisoners of war orderlies were reduced in number as the admissions to hospital diminished, and they were all eventually discontinued on the 20th December. Two soldier orderlies, privates of the Royal West Kent Regiment, have done duty since, and were on the staff at the end of the year.

(2) *General Health.*

The general health of the camp was satisfactory, particularly during the early months of the year. Enteric was wholly absent till April, when there was a re-appearance of the disease. Dysentery, though prevalent in moderate numbers throughout the year, assumed a very bad type towards its end, and contributed largely to the mortality during the period.

(3) *Outdoor Dispensary.*

The total number of cases treated at the outdoor dispensary consisted of 994 patients, making 2,660 visits, or an average of 7 per day.

(4) *Diseases treated in the Hospitals.*

The total number of cases treated in the various hospitals during the year was 718. Of these, 26 died, 689 were discharged, and 3 remained under treatment.

Dysentery.—The total number of cases of dysentery treated was 95, of which 94 were admitted during the year. Of these, 9 died, a mortality rate of 9·4 per cent. As already stated, the type of disease became worse towards the end of the year, when a large proportion of the deaths from this cause occurred.

Malarial Fever.—The total number treated was 35. All recovered.

Debility.—In all 140 cases were treated. There was one death from this cause. Most of the cases occurred among the old and infirm, and usually improved on being taken out of the camp and transferred to the convalescent hospital and placed on a liberal and easily digested diet.

Nervous Diseases.—Two cases of mania and three of melancholia were treated during the year. They were eventually transferred to the Lunatic Asylum, Colombo, for safe custody and expert treatment. One death occurred from tumour of the brain.

Circulatory Diseases.—One death occurred from valvular disease of the heart: the patient was a long time under treatment, with, at the beginning, some improvement. The immediate cause of death was dropsy.

Respiratory Diseases.—There were 20 cases, with three deaths. The deaths resulted from acute pneumonia (two cases) and bronchitis (one case).

Digestive Diseases.—Total treated 244. Of these, 3 died: 2 from intestinal obstruction and 1 from peritonitis.

Venereal Diseases.—One case of ulcer of the penis was treated in the hospital. A few cases of gonorrhœa and syphilis received treatment at the outdoor dispensary.

Enteric.—Total treated 46; deaths 6; mortality rate 13·04 per cent. The camp was free of enteric for the first three months of the year. A small outbreak then occurred, traceable to the drinking of polluted water at Haputale. I have already reported in detail regarding the etiology of this small outbreak in my report in August last.

Operations.—In all 31 operations were done during the year. There was one death, a case of intestinal obstruction, in which lapenatomy was performed.

3.—SANITARY.

Drainage.—The drainage of the camp was satisfactory, and did not necessitate any new works.

Water Supply.—The supply of water was ample throughout the year.

Food.—The rations of the prisoners of war were good, and were daily examined by a board in which the Medical Staff of the camp was represented.

Removal of Excreta.—This duty was efficiently performed.

---

(17) REPORT of the Medical Officer, Prisoners of War Camp at Mount Lavinia, Mr. V. van Langenberg, L.R.C.P., M.R.C.S.

General.—The strength of the camp on the 31st August, 1902, was 85, including three prisoners of war who had arrived on three days' parole from Urugasmanhandiya. The number in camp on 1st September, 1901, was 149. 245 convalescents arrived during the year from Diyatalawa, 12 from Ragama, 1 from Hambantota, 2 from the Lunatic Asylum, Colombo, and 3 from Urugasmanhandiya on parole. 235 returned to Diyatalawa and 4 to Ragama, 83 were transferred to Urugasmanhandiya, and 5 died during the year: 1 in camp, 3 in the General Hospital, Colombo, and 1 in the Lunatic Asylum. The average stay of a prisoner of war in the camp was about four months.

General Health.—The general health has been very satisfactory, and the prisoners of war have continued to derive great benefit from the change. Three prisoners of war were sent back to Diyatalawa on my recommendation, as they did not improve by the change here. Two were suffering from chronic diarrhœa and one from chronic bronchitis. The number treated at the outdoor dispensary was 1,775, as follows:—

Month.	First Visits.	Subsequent Visits.	Total.
1901.			
September	163	66	229
October	139	50	189
November	89	24	113
December	44	15	59
1902.			
January	100	32	132
February	101	52	153
March	97	35	132
April	129	61	190
May	135	62	197
June	98	49	147
July	104	22	126
August	80	28	108

the daily average treated being 4·86, and the monthly average 147·91. The diseases treated were of minor importance, and chiefly due to gastro-intestinal irritation, with a few cases of malarial fever and dysentery of a mild type.

Hospital.—Forty-one cases were treated in the detention ward, which has accommodation for three patients; of these, 3 were cases of dysentery, 5 of intermittent fever, 2 abscess of the liver, 7 diarrhœa, 1 cystitis, 2 heart disease, 2 pernicious anæmia, and 1 concussion of the brain. Sixteen were transferred to the General Hospital, Colombo, 2 of these being abscess of the liver, 2 cancer of the stomach, 1 hydatid cyst of the lung, and 1 pernicious anæmia.

Deaths.—One death occurred in the camp during the year from "pernicious anæmia" in an old man who had been ailing a long time.

Water.—The drinking water is good, and was analysed four times during the year. There is a plentiful supply for bathing and washing purposes.

Food.—The food supplied has been of good quality, and complaints have been very few.

Latrines and Urinals.—These have been well kept, the contractor on the whole doing his work satisfactorily. Limestone has been substituted for broken brick in the urine pits, with very satisfactory results.

Drainage.—The drainage is good, two large surface cement drains carrying away the slops and storm water.

Buildings.—The huts were re-thatched in April, just before the burst of the south-west monsoon.

Exercise and Recreation.—Full advantage is taken of the mile of seashore which is at the disposal of the prisoners of war between the hours of 6 and 9 in the morning and 4 and 6.30 in the evening. Football continues to be the favourite pastime.

Clothing.—The clothing is inspected once a week, and the men are well supplied.

(18) REPORT of the Medical Officer, Prisoners of War Camp at Urugasmanhandiya, Mr. E. W. Scharenguivel.

General.—This camp was opened on 11th September, 1901, on the arrival of 176 prisoners of war from Diyatalawa, and this number was increased from time to time by fresh arrivals. The strength of the camp at the end of each month of the period under review was as follows :—

1901.		1902.	
September	176	March	364
October	213	April	369
November	273	May	368
December	356	June	367
1902.		July	283
January	358	August (up to 10th) ...	13
February	365		

On 14th July 367 prisoners of war and on 7th August 370 prisoners of war left this for South Africa, the first batch leaving Colombo by the ss. Templemore and the second by ss. Englishman.

Sanitary ; Situation.—The camp is located on a hill with low-lying paddy fields surrounding. The surrounding country is well wooded, open, and the soil is gravelly, favouring drainage. The proximity of the sea renders the place much cooler and healthier than it would otherwise be. The railway station which serves it is at Kosgoda, a distance of nearly 4 miles by a metalled cart road.

Drainage.—The drainage is effectively carried out by means of several surface drains, which open into the low-lying fields and carry off the storm water.

Water Supply.—A large and deep well with a wall enclosure supplies the water for drinking purposes. The water is pumped into water carts, which are left in different parts of the camp. There is a plentiful supply, and its quality has been on several occasions analysed by the Government Analyst and pronounced to be pure and wholesome.

Food.—The food of the prisoners of war is of good quality. The cooking is done by native servants. Complaints have been few.

Dwellings.—Huts constructed of mud and wattle walls, with thatched roofs and earth floors. The side walls are 3 feet high, and the huts are lofty, allowing sufficient ventilation. The mess rooms have tables and benches fixed to the ground, with a thatched roof and half walls of cadjan for the sides. The huts are daily swept and cleaned, and the belongings of the prisoners of war put out and aired.

Washhouses and Baths.—Two washhouses provided with tubs, buckets, and tables are in use, the water being supplied by three or four surface wells. There is a bathroom with a cement floor and a thatched enclosure. The water is ample for bathing purposes, and prisoners of war avail themselves of it very freely.

Latrines and Urinals.—There are two sets of latrines and urinals situated at convenient and suitable sites in the camp. The dry-earth system is in force, and the solid excreta are carried some way off and deposited in shallow pits, which are covered over as the pits fill up. A galvanized iron trough is fitted in each urinal, which conveys the urine through a short pipe into an open cement drain, which in turn empties into a pit containing broken brick. These "bacteria beds" have worked very satisfactorily in camp and are free from smell. The brick dressing is renewed weekly and dried. The latrines have been excellently kept by the camp staff of coolies. The whole camp is inspected twice a week by the official staff, and matters needing attention promptly put in hand. From the favourable situation of the camp as regards ventilation and drainage, its sanitary condition has given no cause for anxiety or trouble. The refuse and sweepings from the camp are disposed of by removing them in carts to parts well away from the camp and burying them.

Exercise and Recreation.—The privilege the prisoners of war are given to go anywhere within a radius of 3 miles has been availed of freely. Special permits to a certain number daily are also granted to Kosgoda for sea bathing and to other places in the vicinity. In the way of outdoor games, cricket, football, and quoits were indulged in.

Clothing.—The prisoners of war are well provided with clothing suitable to the climate.

Climate and Meteorology.—Meteorological observations commenced on 29th October, 1901. The highest maximum temperature registered was 91, and the lowest 76. The highest minimum was 82, and the lowest 65. The total rainfall estimated from the 10th December was 80·69 inches. The wettest month was May, registering 23·11 inches ; and the driest month February, with 4·11 inches. The hottest months were March and April. It will be noticed that the largest number of admissions were in June, just after the heaviest monthly rainfall.

Medical Staff.—I took over charge of the camp on the 11th July, 1902, on the departure of Dr. Leembruggen, who went in medical charge of the first batch of prisoners of war that returned to South Africa. Dr. Van Langenberg was in charge of this camp from the date of its opening, visiting twice a week from Mount Lavinia until early in January.

Hospital.—The hospital accommodation consisted of two wards with five beds in each.

General Health.—The general health of the camp was very satisfactory. The number treated at the outdoor dispensary was 2,022, making a daily average of 6·03. The following table shows the number treated for each month :—

1901.		1902.	
September	173	March	191
October	187	April	196
November	142	May	186
December	151	June	180
1902.		July	206
January	149	August (up to 10th) ...	100
February	161		

The nature of the cases treated was very mild, being chiefly minor ailments.

The number of admissions into hospital for the year was 242, as shown in the following table :—

1901.		1902.	
September ...	9	March ...	17
October ...	8	April ...	14
November ...	11	May ...	29
December ...	18	June ...	58
1902.		July ...	26
January ...	24	August (up to 10th)	5
February ...	23		

The daily average sick in hospital was 4·81, and the largest number of patients in hospital in any one day was 13 ; the smallest was 1. There were no deaths. Six cases were transferred to the General Hospital, Colombo, and 5 cases were sent to the Eye Infirmary, Colombo, for examination ; one of the latter was operated on at the infirmary for strabismus. Some cases of inguinal hernia came under notice, to whom trusses were provided.

Fever, Intermittent.—112 cases of this disease were treated.

Appendicitis.—One case, which gave cause for anxiety, was treated, and made a good recovery.

Dysentery and Diarrhœa.—Six cases of the former and 16 of the latter were treated. They were principally attributable to unwholesome food procured outside the camp and to climatic changes. One case of diarrhœa in a weak, emaciated, and elderly subject was transferred to the General Hospital Colombo.

Catarrhal Affections were prevalent generally during the wet months.

Chickenpox.—In June two cases of chickenpox occurred in camp, and were isolated in the segregation hut without further spread the disease was stamped out.

General.—Schools were established in the camp at Government expense and inspected by the Director of Public Instruction. Sites in the camp were allowed for gardening and carpentry, games were much encouraged by the officials, and this with the healthy and cheerful situation of camp tended greatly to the well-being of the men, who seemed very grateful and were contented.

The hospital nursing was satisfactorily carried out by the Boer orderly and native attendants.

---

(19) REPORT of the Medical Officer, Prisoners of War Camp at Ragama, Capt. W. P. Gwynne, R.A.M.C.

I.—GENERAL:

Strength, 1901.		Strength, 1902.	
September 30 ...	305	January 31 ...	316
October 31 ...	331	February 28 ...	322
November 30 ...	322	March 31 ...	318
Decembeer 31 ...	316	April 30 ...	312
		May 31 ...	306
		June 30 ...	331
		July 31 ...	217
		August 10 ...	213

Since peace was declared the strength of the camp has been much reduced. This is due to the fact that arrangements were made by their respective Consuls for the return of all those foreigners who were desirous of proceeding to their own countries. The largest number of prisoners in the camp at any one time was in July, 1902, when there were 358.

II.—SANITARY.

(*a*) *Drainage.*—There are surface cement drains all over the prisoners' enclosures ; these have proved most satisfactory, having been tested by heavy rains.

(*b*) *Water Supply.*—The water is pumped from two wells close to the railway line into seven reservoirs holding 6,460 gallons in all. The water is of good quality as tested by analysis, and is sufficient for all requirements. It is distributed over the camp at standpipes. Two of the old cooly reservoirs have been utilised as swimming baths for the prisoners of war. On the 14th December chatty filters were instituted in the camp, two filters for each tent and two for each dining-room ; the sand and charcoal used are renewed from time to time ; they act very satisfactorily. An additional well was made during the year in case of a shortage of supply.

(*c*) *Rations.*—On the 3rd November, as it was found that much of the meat was left uneaten, the following ration was recommended, and is now in use :—

Beef or mutton	... ¾ lb.	Tea	... ⅝ oz. or
Potatoes	... 11 oz.	Coffee	... 1⅝ "
Fresh vegetables	... 3 "	Sugar	... 2½ "
Rice	... 2 "	Salt	... ½ "
Bread	... 16 "	Pepper	... 1/32 "
Milk	... 4 "	Jam (weekly)	... ¼ lb.
Peas or beans (dried)	... 4 "	Lime juice	... ½ oz.

This ration suits the prisoners far better than the old ; there has been less dyspepsia, diarrhœa, &c. Milk has been issued from hospital to a certain number of out-patients at my own descretion. The food during the year has been of good quality.

(*d*) *Removal of Excreta.*—The latrines are worked on the dry-earth system. A pint of the following solution is put into each bucket every day (half a pint when empty and half a pint when full):—Corrosive sublimate 1 in 1,000 with ten parts of chloride of sodium, the solution being coloured with methyl blue. The buckets are emptied twice daily, and the excreta burnt in the incinerator, which is acting well. 900 lb. of wood are burnt each day in the incinerator for the Boer camp alone. The urine is conveyed by underground pipes into square pits 9 feet deep and 9 feet wide : (1) the lower third of which is filled with broken bricks ; (2) middle third a layer of broken bricks and coke breeze ;

more brick than coke; (3) upper third to within 2 feet of the surface brick and coke breeze mixed, more coke than brick. Storm water is kept out of them by entrenching around their margins and embanking on the pit side of the entrenchment. No disinfectant is placed in these, and they have answered their purpose most satisfactorily.

(*e*) *Ablution.*—A large ablution room has been provided in each camp with concrete flooring sloping to a central drain. Tubs and buckets are provided for washing purposes.

(*f*) *Dwellings.*—These consist of cadjan huts with galvanized iron roofs and concrete floors. Each hut accommodates 55 prisoners, and is 100 feet in length and 25 feet in width.

(*g*) *Ventilation.*—The upper portion of the side walls of the huts consist of cadjan tats, which are raised during the day, allowing thorough ventilation. All the beds and bedding are put out in the sun daily during fine weather, and clothes lines are provided for hanging out blankets, towels, clothing, &c.

(*h*) *Clothing.*—This is issued liberally to the prisoners of war according to requirements and medical recommendations.

(*i*) *Recreation.*—Quoits, shuttle alleys, carpenters' shops, music, and dancing, football, swimming baths, horizontal and parallel bars, are provided for this purpose.

(*j*) *Climate and Meteorology.*—The climate of Ragama is on the whole very good.

III.—MEDICAL.

(*a*) *Hospital.*—There is one hospital consisting of a ward with accommodation for 20 patients. There were 115 cases treated during the year.

Daily Average of Sick in Hospital for each Month.

1901.		1902.	
September ...	7·9	March ...	4·9
October ...	9·8	April ...	5·7
November ...	8·8	May ...	5
December ...	7·1	June ...	5·7
1902.		July ...	6·4
January ...	9·6	August (up to 10th) ...	6
February ...	4·7		

The largest number in hospital on any one day was 13, the smallest 2. Percentage of sick to prisoners for the year was 3·7.

There has been one case of infectious diseases, "smallpox," imported from Hambantota by a prisoner on parole there, who returned here with the disease in its incubation stage. There were 23 mild cases of dysentery, 25 cases of ague, 1 case hydatid lung, 4 cases bronchitis, 1 case abscess liver, 1 case pleurisy treated during the year. The others treated were minor cases only. There have been no deaths and no cases of enteric.

The hospital staff consists of myself in charge, an apothecary, and nurse orderlies from among the prisoners of war, who are paid for their services.

All have performed their duties to my entire satisfaction. A few cases of incurable disease and diseases dangerous to life have been recommended for release; and others whom the climate seemed not to suit have been sent for change to other places in Ceylon.

The hospital supplies have been to my entire satisfaction. The invalid diets have been well cooked and served.

---

(20) REPORT of the Medical Officer, Prisoners of War Camp at Hambantota, Mr. A. Ludowyk.

General.—The prisoners of war camp at Hambantota was opened on the 19th September, 1901, when a batch of 57 prisoners of war were sent from Diyatalawa. Of this number, 32 were officers and 25 were Burghers. At the beginning of the year under review there were 57 prisoners of war in the camp. During the year there were several new arrivals from Diyatalawa and Ragama, so that in the month of April the number in camp rose to 92.

Sanitary.—The jail, which was utilised as a prisoners of war camp, is admirably situated and well adapted for the purpose. The increase in the number of prisoners of war during the year necessitated the erection of two temporary sheds of sixteen beds each. These buildings were well ventilated and supplied with an efficient system of surface drainage.

Water Supply.—The water, which was supplied by a contractor from wells, was slightly brackish, and contained a certain amount of suspended matter, which was easily removed by filtration at the beginning of the year.

Drainage.—There was an efficient system of surface drainage for the premanent buildings as well as for the temporary sheds. The drains were flushed and disinfected twice a day.

Food.—The food supplied was wholesome and nutritious. The daily ration was the same as supplied at Diyatalawa.

Excreta.—The excreta were removed twice a day and thrown into the sea. There were two dry-earth latrines of large size, which were cleaned and disinfected twice a day.

Accommodation.—There was no overcrowding. There was a sufficient amount of cubic space.

Recreation.—The prisoners of war were allowed full liberty to walk out of the camp within a radius of 8 miles from 5 A.M. to 8 P.M. In the evenings some of them used to take part in cricket, tennis, or football.

Clothing.—Linen clothing was liberally supplied.

Hospital.—No cases were admitted to hospital during the year.

Outdoor Dispensary.—The total number treated during the year was 842. Of these, 477 were new cases and 365 were subsequent visits. There have been no outbreaks of infectious diseases of any kind.

Departure of Prisoners of War and Closing of Camp.—At the time of the declaration of peace there were 57 prisoners of war in the camp. On the 18th July 50 of them left by the ss. Lady Gordon for Urugasmanhandiya. The remaining seven, who were at the time recovering from intermittent fever, were detained, as they were unfit to travel by steamer. These left Hambantota by coach on the 27th July, and from that date the camp has been closed.

POST AND TELEGRAPHS.

REPORT OF THE POSTMASTER-GENERAL AND DIRECTOR OF TELEGRAPHS FOR 1902.

DURING the year 1902 the increase of business was generally maintained.

Mails.—The weight of mails from Ceylon to the United Kingdom is shown in the following table for ten years :—

Year.	By P. & O. Packets.		By Orient Packets.		By French Packets.		By German Packets.		By Bibby Line.		Total.	
	Letters and Post Cards.	Other Articles.	Letters and Post Cards.	Other Articles.	Letters and Post Cards.	Other Articles.	Letters and Post Cards.	Other Articles.	Letters and Post Cards.	Other Articles.	Letters and Post Cards.	Other Articles.

1900 ...	6,506	19,153	4,721	13,730	1,164	3,283	1,126	3,098	—	—	13,517	39,264
1901 ...	7,211	20,817	5,399	14,240	1,485	4,014	1,774	4,479	—	—	15,869	43,550
1902 ...	7,464	21,226	5,700	15,933	1,422	4,333	1,825	5,630	115	351	16,526	47,473

The increase in weight of letters and post cards to London and Europe between 1901 and 1902 was 657 lb., and in other articles 3,923 lb. Seventy-nine per cent. of the mails were despatched by British steamers, 12 per cent. by German, and 9 per cent. by French. The sudden rise in the weight of letters and post cards in 1899 was the effect of the All-British penny postage introduced on Christmas Day, 1898. The rise in 1901 was caused by the presence of the Boer prisoners of war and additional troops.

The number of articles other than parcels which passed through the post in 1902 is estimated as follows :—

Class.	Posted in Ceylon.			Received from other Countries.	Total.
	At Colombo.	At other Stations.	Total.		
Letters prepaid	2,808,378	6,128,676	8,937,054	2,902,770	11,839,824
Letters franked	679,536	1,828,278	2,507,814	—	2,507,814
Post cards	672,732	1,270,512	1,943,244	391,986	2,335,230
Printed matter	3,550,446	954,450	4,504,896	1,791,072	6,295,968
Total ...	7,711,092	10,181,916	17,893,008	5,085,828	22,978,836

The total increase in the year is about 9 per cent. The numbers of articles of each class of postal matter posted at outstation offices and received from abroad show steady increase. The figures for Colombo give a slight decrease in paid and franked letters posted at the General Post Office, and an abnormal increase in newspapers and printed matter. It is possible that there was a fault in the counting for statistics, and this year an improvement in the method has been introduced in order to obtain more accurate results.

113,101 letters registered and insured were posted during the year, of which no less than 76,823 were handed in at the General Post Office, Colombo. The fees collected amounted to Rs. 6,766·83, and no charge was made against this sum for loss.

Parcels.—The total number of parcels which passed through the post was as follows :—

	Ordinary.	Value-payable.	Total.
Inland	208,121	65,473	273,594
Indian	23,440	47,913	71,353
United Kingdom	25,211	—	25,211
Other Countries	7,918	—	7,918
Total ...	264,690	113,386	378,076

The number of parcels dealt with in the Parcels Branch of the General Post Office for nine years is given thus:—

Year.	Inland.						Foreign.			Grand Total.
	Posted at the General Post Office.				Received in Transit to other Offices.	Total.	Despatched.	Received.	Total.	Inland and Foreign.
	Ordinary.	Value-payable.	Service.	Total.						
	No.	No.	No.	No.	No.	No.	No.	No.	No.	No.
1894	55,858	18,348	—	74,206	29,881	104,087	10,426	26,626	37,052	141,139
1895	55,252	20,970	11,377	87,599	31,187	118,786	14,607	36,244	50,851	169,367

1897	54,717	28,994	14,771	98,482	21,771	120,252	12,645	43,785	56,430	176,683
1898	55,947	30,005	14,296	100,248	22,160	122,408	13,868	45,167	59,035	181,443
1899	58,581	30,898	13,920	103,399	24,112	127,511	16,148	55,498	71,646	199,157
1900	59,827	33,028	16,938	109,793	39,372	149,165	17,288	64,858	82,146	231,311
1901	63,001	39,347	19,533	121,881	47,085	168,966	21,704	71,370	93,074	262,040
1902	54,929	47,461	17,776	120,166	47,545	167,711	25,035	79,447	104,482	272,193

A statement for ten years of the parcel post exchange with the United Kingdom, British Colonies, and foreign countries appears on the opposite page.

Foreign parcels generally show the same steady increase as in the previous four years. Inland parcels show a fall in number of 1,255, which is more than accounted for by the welcome reduction in the number of official parcels posted at Colombo.

Inland value-payable parcels from Colombo show rapid increase thus :—

Between 1899 and 1900	7 per cent.
Between 1900 and 1901	19 per cent.
Between 1901 and 1902	20 per cent.

On the other hand, ordinary parcels posted at Colombo fell 12½ per cent. Perhaps the low price of tea checked the purchase of shop goods for up-country needs.

The Indian parcel service continues to expand in both directions, the reduced rates of postage having accelerated the growth in the year under review.

The figures are worth showing specially thus :—

	Number of Parcels.		
To India.	1901.	1902.	Increase per cent.
Ordinary	8,507	11,125	30·77
Value-payable	770	1,300	68·83
From India.			
Ordinary	11,218	12,315	9·78
Value-payable	40,079	46,613	16·30
Total ...	60,574	71,353	17·79

The decrease of 314 despatched to and 728 received from the United Kingdom is partly due to the establishment of more direct services to other countries. The overland route saving a week in transmission at an additional charge of 75 cents (or 1 shilling) per parcel, is becoming more popular. The increase in the exchange with other countries is 27 per cent., and the growth is satisfactory in every exchange. The decrease in the service with Mauritius and New Zealand does not indicate fewer parcels, but is due to Colombo having ceased to be a medium between those Colonies and India, parcels now going in closed mails.

On value-payable parcels the collections for the senders amounted to Rs. 633,372, Rs. 298,438 to senders in Ceylon and Rs. 334,934 to senders in India. The average value of an inland value-payable parcel was Rs. 4·56, and of an Indian value-payable parcel Rs. 6·99. The Customs duty collected on all parcels was Rs. 66,960·75.

No new services of importance were inaugurated during the year. Of the many revisions of routes and rates made, the most interesting are the route to the United States of America, which, instead of going *viâ* India, Italy, and Switzerland, now goes direct to London, and thence to New York, and the reduction of the rates to the Australian Colonies.

The question of increased accommodation for the Parcels Branch is becoming more and more urgent, the handling of large and rapidly increasing numbers of parcels in a confined space being difficult and dangerous, and being the cause of delay and inconvenience to the public.

Returned Letter Office.—The number of articles dealt with in the Returned Letter Office for ten years is given thus :—

Year.	Total No. of Letters received.	Total No. of Letters returned to Senders.	No. of Letters destroyed.	Property found. Value. Rs.
1893 ...	69,820	65,450	4,370	6,137
1894 ...	74,335	61,149	13,186	3,483
1895 ...	113,758	101,865	11,893	5,624
1896 ...	127,195	110,182	19,769	14,928
1897 ...	134,570	114,930	27,783	8,622
1898 ...	146,806	122,063	24,743	11,213
1899 ...	161,618	129,250	32,368	8,955
1900 ...	170,320	141,399	28,981	12,655
1901 ...	171,027	156,820	14,207	8,557
1902 ...	168,569	145,901	22,370	10,258

It is satisfactory to note that there was a decrease of 2,458 in the number of articles received. The office was able to return to the senders 10,919 less than in 1901, and had to destroy 8,163 more. This was entirely due to letters addressed to Boer prisoners of war, which after failure to deliver in Ceylon were returned to South Africa, and were again sent to Ceylon, the original senders not having been found.

[For Statement regarding Money Order Business with British Colonies and Protectorates see page 5.]

The business showed a slight fall in 1901 and recovered in 1902. As I remarked in my report for 1901, the year 1900 was abnormal.

The percentage of increase in the number of orders and their amount between 1901 and 1902 is as follows :—

	Number.	Amount.
Inland	7·58	4·26
Indian	9·67	6·37
United Kingdom	14·01	12·33

There was a decrease in business with the Colonies and foreign countries of 2·38 in number and 4·05 in amount.

The increase in Indian business was in ordinary and value-payable parcels, money orders, telegraphic orders being almost stationary. The business with Victoria, Western Australia, and Tasmania was affected by the action of the Australian Government against lottery offices. There was a slight decrease in the remittance of money from the Straits Settlements, which is nearly all from Ceylonese people employed in that Colony. In all other exchanges there was an increase. The nett amount of commission collected was Rs. 72,600. The commission on 17,086 free service orders of the value of Rs. 924,226 was Rs. 10,322. Further attempts were made to establish direct exchange with the other South African Colonies through Natal, but the departure of the Boer prisoners of war has removed the immediate impetus to traffic, and the uncertainty of the direct mail service renders success doubtful.

Postal Orders.—The following table shows the sale of postal orders for ten years. There is a steady advance. The 5-rupee order has the largest sale, and the 7½-rupee order the lowest. The popularity of this convenient method of sending small sums varies with districts. In the Jaffna peninsula, for instance, very few postal orders are sold :—

Postal Orders sold, and Commission earned, for the last Ten Years.

Year.	Number of Orders at										Total Number of Orders.	Total Value.	Commission.

Post Office Savings Bank.—The Post Office Savings Bank showed marked improvement. The deposits increased by 5,856 in number over the previous year, and the amount of the deposits exceeded the withdrawals by Rs. 115,591. The number of accounts open at the end of 1902 was 57,007, the amount to the credit of depositors was Rs. 1,454,858, and the amount invested in Government securities Rs. 1,502,106. The average balance remains low, showing how the institution is made use of by comparatively poor people. This is of course the object of a Post Office Savings Bank. The business for ten years is shown as follows :—

Post Office Savings Bank Business for the last Ten Years.

Year.	Number of Offices.	Deposits.			Withdrawals.		Average Balance to each Account	Cost of Establishment.	Depositors' Accounts.			Amount to credit of Depositors.	Amount of Invested Funds.
		Number.	Amount.	Interest credited to Depositors.	Number.	Amount.			Number opened.	Number closed.	Number remaining open.

Telegraphs.—The report of the Superintendent of Telegraphs, which is annexed, deals fully with the details of the construction and maintenance under his charge, and with the question of the efficiency of the service.

I endorse his opinion as to the desirability of a line between Kalkuda (Batticaloa) and Trincomalee, and the speedy continuation of the Rakwana-Deniyaya line sanctioned for 1903 to join the south coast line. When these are completed no important station will be without alternative communication.

The development of the use of Wheatstone's automatic instruments is also very desirable. A few more men will be required, but the increased speed of transmission will be of great value, and the accuracy of long messages should be improved. I trust that the additional line between Colombo and Anuradhapura, which will in effect give an additional wire to India while assisting local traffic, will be added to the lines on the Northern Railway next year to meet the additional wire which the Indian Administration intend to erect.

The policy of using iron posts, except near the sea, and copper wire within reach of the sea salt is undoubtedly right. The initial cost is greater, but the difference is covered in a few years of maintenance.

The following is a statement of the revenue and expenditure of the Telegraph Branch for 1902:—

Revenue of the Telegraph Branch for the Year 1902.

	Rs. c.	Rs. c.		Rs. c.	Rs. c.

Miscellaneous	277 40				
		5,154 19	Balance in favour of the Ceylon Government	—	192,192 26
		671,016 16			671,016 16

The fall in revenue of Rs. 22,864 is more than accounted for by the fact that on my recommendation it was decided that the Post Office should no longer be paid by the Railway for the maintenance of its Telegraph System. The amount so paid in 1901 was Rs. 23,305.

There was a considerable fall in the gross receipts from telegraph stamps, mainly due to the reduction in the rates to Europe on the 1st March, 1902. The effect of the reduction is shown thus :—

Foreign Private Telegrams.

	Number.	Value. Rs.	Average Cost. Rs. c.
1901	15,119 ...	330,012 ...	21 83
1902	16,529 ...	294,146 ...	17 80
Increase	1,410	— ...	—
Decrease	— ...	35,866 ...	4 3

This decrease in the cost of telegrams does not mean a corresponding decrease in revenue, because, while the rate per word to Europe was reduced 37½ per cent., the Ceylon terminal rate (*i.e.*, what Ceylon earns) was reduced by 13 per cent. only.

The next table gives a classification of messages for four years :—

Number of Telegrams of all Classes despatched since the Year 1899.

I am glad to see a substantial reduction in Inland Free State and in Urgent Paid messages. I should be glad to see the urgent rate abolished. It is the cause of much disappointment and trouble.

The total number of telegrams during the year exceeded that of the previous year by 1,109 only, a decided check on the rapid growth of previous years. The ordinary inland paid telegram shows a very much smaller increase than in any previous year since the introduction of the 25-cent rate, and there is a remarkable fall in the number of telegrams to India. Foreign paid telegrams show the normal advance.

Revenue and Expenditure.—Statements of the revenue and expenditure of the Department are now presented.

Revenue of the Post and Telegraph Department for 1902.

1898	228,883 31	147,886 35	555,606 47	932,376 13
1899	252,710 72	152,974 84	558,729 20*	964,414 76
1900	278,284 33	166,462 92	646,676 87*	1,091,424 12
1901	301,994 14	179,061 13	571,620 79*	1,052,676 6
1902	316,484 33	189,311 38	619,361 39*	1,125,157 10

* These figures include special expenditure on Telegraph and Telephone construction.

The revenue of 1902 exceeded that of 1901 by Rs. 10,526·63. The normal rate of increase was maintained under every head except Telegraph Receipts, on which there was a decrease, already referred to, and Telephone Receipts, which remained stationary.

The expenditure exceeded that of the previous year by Rs. 72,481·04. Special expenditure amounted to Rs. 43,360·08, against Rs. 17,943·53 in 1901 and Rs. 117,031·30 in 1900. The ordinary recurrent expenditure increased during the year by Rs. 47,064, of which Rs. 24,740 was due to increments of salary and additions to the staff and Rs. 22,324 to other Charges. The expenditure thus appears to exceed the revenue and to be increasing yearly much faster than the revenue, but if the value of work done free for other Government Departments is considered the balance is in favour of the revenue. The principal heads are :—

	Rs.
Commission on Service Money Orders	10,322
Upkeep of Railway Telegraphs	26,000
Upkeep of Official Telephones	8,500
Postage on Official Correspondence	168,000
State Telegrams	45,500

Complaints.—A statement of complaints of lost postal packets is given below :—

Complaints relating to Loss of Letters, Parcels, Books, &c., posted during January–December, 1902.

Offices.—The following offices were opened in 1902 :—

Receiving Offices.

Dewalapola, Western Province.
Poddala, Southern Province.
Karawanella, Province of Sabaragamuwa.
Segersta, North-Western Province.
Iranamadu, Northern Province.

Post Offices.

Horana, Western Province.
Galaha, Central Province.

Telegraph Offices.

Deltota, Central Province.
Teldeniya, Central Province.
Henaratgoda, Western Province.

The Village Receiving Office at Padukka, Kelani Valley Railway, was closed and a Railway Receiving Office substituted.

The Post Office at Weuda, North-Western Province, was closed and a Receiving Office substituted.

The names of the following Receiving Offices were altered :—

Dikwella (Province of Uva) to Hali-ela.
Kalaha (Southern Province) to Galgamuwa.
Madampe (Province of Sabaragamuwa) to Atakalanpanna.

Mail Services.—A very bold attempt was made to establish a motor coach service between Lunugala and Batticaloa, and I regret that it failed and that the courageous promoter must have lost considerably. It was found that pneumatic tires would not stand the temperature, and that the machines were not suited for the rough road to Batticaloa. On the failure of the motor experiment a horse coach was arranged for, a great improvement on the old bullock coach service.

The completion of the Kelani Valley Railway as far as Avisawella enabled the Post Office to send mails by train instead of coach.

The coach between Veyangoda to Yatiyantota was discontinued, and the subsidy so saved has since been used for the improvement of the services between Avisawella, Ratnapura, Balangoda, and Rakwana, the two last-named places having now a through service in one day.

In the absence of Sunday trains the opening of the Northern Railway between Kankesanturai and Pallai did not enable the Post Office to effect any economy, but it made it possible to substitute for the runner service a coach from Jaffna to Batticotta *viâ* Manipay.

The coach service from Talawakele to Agrapatana, started as an experiment in 1901, proved successful, and was continued in 1902.

Additional coach services were established between Negombo and Chilaw and between Avisawella and Yatiyantota.

The coach services have been undoubtedly improved, but they are not what they might be. It is all a question of money. With a sufficient subsidy for mails, sufficient charges for passenger traffic, and a monopoly of the line, a contractor can run a coach satisfactorily in Ceylon. If he is obliged to cut down his passenger rates by competition, he must take the difference out of his upkeep. If the Government subsidy is reduced by competition, the same result follows. I have no doubt that the acceptance of the lowest tender has been the cause of cruelty to animals. The contractor must get the mails through, and the Post Office must insist upon his doing so. The mails cannot be stopped because a horse is galled or is lame, and the order of an Inspector to take a horse off the line must be inoperative unless there is another horse at hand to take its place.

In recent contracts provision has been made for relief horses and for a penalty on the use of a galled horse. On some lines also competition has been checked, and the policy of the Post Office is to ascertain for what subsidy a coach can be properly run, and to give the contract to a man who can run it, preferably to a man who has some affection for a horse and knows how the animal should be treated.

I do not wish unduly to uphold the contractor, but my experience is that he has a hard time on some lines. Take, for instance, the line from Bandarawela to Lunugala, where Australian horses can be used, and where the roads can be kept in order because there is plenty of water at hand. The service is very good. Go on from Lunugala to Batticaloa, and a country is reached where water is scarce, elephant flies are present in numbers, the road cannot be kept in good order except at great expense, and Indian horses alone can stand the conditions. The mortality in horses is great, and the service is of course inferior. Similar comparison may be made on the North road and on the Puttalam road.

The whole question is one of money. In dry districts roads cannot be kept in order without water, which is not at hand ; horses cannot be kept in health without sufficient grass, which has to be carried to them ; efficient men cannot be got at ordinary rates for the stables at unhealthy places. But the money should not be provided entirely by the Government. The public, who want a better service, should be prepared to pay higher rates, and perhaps something more towards the upkeep of roads. Taxation in Ceylon is very light. If the road tax were raised throughout the Island to Rs. 2, and the money applied to the roads in dry districts, the water for consolidation might be obtained.

Miscellaneous.—The following incidents are of more or less interest.

Complaint was made of the loss of a letter containing a cheque posted to the address of the Egyptian Tobacco Company. It was found under an almirah in the addressee's shop.

The sender complained of the non-delivery of a letter containing a money order. It was returned to him through the Returned Letter Office. He had forgotten to address it.

Another complaint of non-delivery of a letter containing a money order resulted in the sender discovering that he had forgotten to post it.

A letter containing a money order for Rs. 100 was reported undelivered. It was said to be addressed to Balapitiya. The order was subsequently sent to the General Post Office from Hatton with an unsigned memorandum, "Whose this order is we know not. It came to Hatton to my address. It does not belong to me."

In another case of supposed loss of a money order it was found that a neighbour of the addressee had taken the letter and forgotten all about it for nearly a month, and in another the addressee himself had mislaid the letter and found it after making complaint.

A cover bearing no address and containing a letter and a postal order for Rs. 5 was found in the Returned Letter Office and returned to the sender, who had meanwhile complained of non-delivery.

The Superintendent of a tea estate said he had not received a packet of printed post cards sent to him by his agents. The packet was, however, traced to him, and he admitted that he had received and mislaid it.

A lady complained of the non-receipt of a large cover containing invoices from a firm in Colombo. The papers were subsequently found at her house. The packet had been delivered to a servant in the ordinary course.

A letter posted at Cinnamon Gardens containing a cheque was addressed to Guildford House, Guildford crescent. It was sorted to London, and after trial at Guildford street, London, and at Guildford was returned to Ceylon and delivered. Local letters should always be superscribed "Local," unless the post town is added, and the latter course is by far the safer.

A parcel posted to Messrs. Mann &. Co. was reported not to have reached them. It was found in the Returned Letter Office addressed to Manson & Co.

A parcel posted containing keys was received without the contents. The keys had burst the cover, and were fortunately picked up on the floor of the Parcels Office.

A Buddhist priest sent a value-payable parcel, on which Rs. 5·15 was recovered from the addressee. When opened the contents were found to be only pieces of paper. The priest was found and prosecuted, and was sentenced to three months' rigorous imprisonment.

Several letters from a firm in the Fort were found posted without stamps, which appeared to have been removed, and the thief was of course supposed to be in the Post Office. The firm's messenger boy was watched, caught, and convicted, and received ten cuts with a cane.

A telegram was sent by a cooly for delivery to a gentleman on an estate in Nawalapitiya district. The messenger did not return with the receipt, and it was ascertained that another gentleman took the opportunity of sending a telegram for despatch by the man, giving him Rs. 5 to be given to the Postmaster. The man was caught and sent to prison for a month.

An opened letter containing a money order in favour of a non-commissioned officer was found re-posted in the General Post Office letter box. He had inadvertently picked it up with other regimental letters for the post.

In January, 1902, the pillar box in the General Post Office hall was removed to the store in the basement, which is open to Prince street. It was wanted for another purpose in September, and on being opened was found to contain seven post cards and four letters varying in date from February to August.

A letter was reported to have gone astray in the post. It had been dropped by the messenger to whom it was given to post, and a child brought it to the Post Office as having been picked up on the road.

A mail bag from Alutnuwara to Badulla was carried away by a river in flood on the 2nd July. The contents were a few Service letters.

A runner from Marassena to Kandy on the 14th August lost a bag and was dismissed.

In February the mail, containing an official remittance of Rs. 1,150, between Koslanda and Haputale was attacked and robbed at night. The Assistant Postmaster and some friends had arranged to steal the money, and he had been careful to enter false numbers of notes in the office record of the remittance. The Postmaster, the headmen, and others however took immediate steps, the Assistant Postmaster's courage failed him, and he confessed, and his confederates followed his example. The whole of the money was recovered. The Assistant Postmaster was sentenced to eighteen months' rigorous imprisonment, his two friends to six months each, and the runner to three months.

There were three defalcations in the year: one connected with Savings Bank accounts, another with the fraudulent use of telegraph stamps, and the third with the embezzlement of sums paid in for Indian money orders.

Staff.—During the year 1902 six officers died, five resigned, five retired, and five were dismissed.

I have, in conclusion, to thank the staff officers and the officers of the Department generally for the loyal manner in which they have carried out their various duties.

Postmaster-General's Office,
Colombo, May 8, 1903.

H. L. MOYSEY,
Postmaster-General and Director of Telegraphs.

REPORT OF THE SUPERINTENDENT OF TELEGRAPHS FOR 1902.

Extensions.

CONSIDERABLE as were the telegraph extensions in 1901, the mileage of new wire erected in 1902 exceeds the former and nearly equals the mileage put up in 1858, when telegraphic communication was first opened in Ceylon. The mileage of new wire put up in 1902 was 300, as against 269 in 1900 and 322 in 1858. Seventy-three miles of wire and posts on the roads were dismantled, of which 32 were re-erected on the railway line and are included in the above 300 miles, of which details will be found below. Of the 300 miles erected in 1902, 104 miles were erected for postal-telegraph work, and 196 miles for the railway telegraphs and railway block signalling.

The following new lines were completed during the year for postal-telegraph purposes:—

(1) Kandy to Deltota—12 miles of wire on new posts.
(2) Kandy to Teldeniya—12 miles of wire on new posts.
(3) Kankesanturai to Elephant Pass—43 miles wire: 11 on new railway posts, and 32 on existing posts shifted from the road to the railway line.
(4) Colombo to Avisawella—37 miles of wire on existing posts.

This makes a total of 104 miles of wire and 24 miles of new posts.

For the Railway Department the following new lines were erected:—

(1) Kankesanturai to Elephant Pass—43 miles of new wire: 11 miles on new posts, and 32 on existing posts shifted from the road to the railway line.
(2) Colombo to Avisawella—(2 wires) 74 miles of new wire on new posts.
(3) Colombo to Ambalangoda (section of new Galle circuit)—52½ miles of new wire, involving the erection of 44¾ miles of new posts.
(4) Mount Lavinia to Panadure (2 wires for Tyer's tablet block signalling)—17½ miles of new wire on existing posts.
(5) Maradana to Ragama (Tyer's tablet wire)—9 miles of wire on existing posts.

The lines erected for railway purposes amount to 196 miles of new wire and 92¾ miles of new posts.

The new Post Office wires erected between Kankesanturai and Elephant Pass and between Colombo and Avisawella have been run on the new railway posts. This was a decided advantage in the case of the Jaffna-Kankesanturai section, the old postal-telegraph wire, which had been suspended on split palmirah posts, having been in a very dangerous condition. This old route, together with the old Jaffna-Elephant Pass line, were removed when the new wires were erected. It was also found

advantageous in the case of the old Avisawella line along the coach road to remove this altogether and run a new wire on the railway telegraph posts.

At the same time that the new wire to Galle for railway purposes was in course of erection the opportunity was taken of putting in higher and more substantial posts on the road section from Kollupitiya bridge to Wellawatta toll bar, and the old iron wires were removed. This piece of re-construction was badly needed, and has effected a considerable improvement in the working of postal and railway wires running along this route.

From Wellawatta toll bar to Galkissa the number of posts per mile was increased in order to reduce the length of the spans and enable a better regulation of the wires to be maintained. Out of the five wires on this section four are now copper, and the remaining iron wires will be replaced by a copper one shortly. These works on the Colombo-Galkissa section involved 32 miles of re-wiring and 6 miles of re-construction of the line of supports.

List of New Telegraph Offices opened during 1902.

Northern Railway Offices.

1. Kankesanturai	5. Chavakachcheri
2. Chunnakam	6. Kodikamam*
3. Jaffna	7. Pallai
4. Navatkuli*	8. Elephant Pass

Avisawella Railway Offices.

1. Nugegoda	5. Kosgama
2. Pannipitiya	6. Puwakpitiya
3. Padukka	7. Avisawella
4. Waga	

Postal Offices.

1. Deltota	3. Teldeniya
2. Henaratgoda	

Temporary Offices.

1. Kosgoda Camp	3. Maradankadawala
2. Racecourse	

* Subsequently closed, as found unnecessary.

This is the largest number of telegraph offices ever opened in Ceylon in one year.

New Wires in hand or sanctioned.

Avisawella to Yatiyantota	Railway
Ambalangoda to Galle	Railway
Nanu-oya to Ragalla	Railway
Colombo to Elephant Pass *viâ* Kurunegala	Railway

New Postal-Telegraph Offices sanctioned.

Dehiowita	Weligama

Lines required.

Anuradhapura to Kurunegala along new railway route and on to Colombo as an alternative line and to take the excess traffic to Madras or Jaffna. At present we have lines from Anuradhapura to Talaimannar and Anuradhapura to Jaffna, of which comparatively little use is made owing to there being no spare line from Anuradhapura to Colombo to connect.

Deniyaya to Matara or Tangalla as an alternative line for the southern traffic during the south-west monsoon. The construction of this line was approved by Government in 1899, but its construction has been delayed by press of other work.

Kalkuda to Trincomalee.—Required mainly as a strategic line for military and naval purposes to ensure the maintenance of telegraphic communication with Trincomalee in time of war, and also as an alternative route between these two places. Twice during 1902 Trincomalee was cut off from telegraphic communication for three days owing to interruptions of the line. Such interruptions might lead to serious results in war time.

A second wire for the Railway Department is very necessary between Kandy and Nanu-oya, as an extension of the present Colombo-Kandy through wire, to give rapid communication between Colombo and the more important up-country stations, and especially to put the District Superintendents at Nawalapitiya in direct communication with the Head Office. This wire might be put up in three sections, viz., Kandy-Nawalapitiya, Nawalapitiya-Hatton, Hatton-Nanuoya, erecting one section a year until completed.

Cables.

The cables from Ceylon to India and that across the Jaffna lake have worked well throughout the year.

Military Vibrator Telegraph Service.

The Military authorities continue by permission of the Postmaster-General to utilize the postal wires between Colombo and Kandy, Colombo and Nuwara Eliya, and Kandy and Trincomalee for their vibrator service.

Boer Prisoners of War Camps.

The electric alarm round the Ragama Camp worked satisfactorily during the year; there were no escapes from inside the net. On the departure of Boer prisoners the Telegraph Offices at Ragama and Diyatalawa were kept open for other purposes, and that at Urugasmanhandiya was closed.

Inspection of Telegraph Lines and Offices by Superintending Officers.

This work is still much in arrears, lines and offices that have been opened for some years not having yet been inspected. It is practically impossible with the present staff to keep this important branch of my work up to date.

Maintenance.

Most of the lines were gone over by an Inspector or a Sub-Inspector with a repairing party and the necessary repairs executed.

Owing to the great difficulty in obtaining wooden posts for repairs I have in several places commenced repairing the lines now on wooden posts by extending the use of iron posts from each end of the line and using the serviceable posts removed for repairs in the central portion; by this means the use of wooden posts will eventually be considerably reduced.

Heavy repairs will be required before long on the Colombo-Kandy section, for which a special vote will be necessary.

The use of copper wire near the coast should be extended. It is by far the cheapest in the long run, and is much more satisfactory altogether, the continual renewal of the iron wire taking up much of the time of a limited staff, who have more work than they can get through.

Maintenance of Railway Telegraph Offices.

Owing to the General Manager, Ceylon Government Railway, wishing to have all matters connected with the railway in his own hands, the question of the maintenance of the railway telegraph offices being handed over to that Department (with a separate staff to look after them) is under consideration. This step, if taken, will not tend to economy, and an improvement in efficiency is extremely doubtful. Some addition to my staff is, however, absolutely necessary to cope with the increased work brought on by the large recent extensions.

With my present staff I find that I am unable to give the railway telegraph offices that attention which is necessary for their proper maintenance.

Tyer's Tablet System (Railway Block Signalling).

This system, which was taken over by the Postal-Telegraph Department on the 6th January, 1902, has proved very expensive to maintain, and, despite every possible care on the part of the comparatively large maintenance staff, has given considerable trouble.

The number of sections controlled by the tablets was six, all short ones of about a mile, and the number of times there was a total failure of the apparatus was 102. The average duration of each interruption was 2 hours and 16 minutes. In addition to the above there were many occasions on which the machines were reported to be partially out of order.

The sections taken over extended from Maradana to Wellawatta, and very shortly will be further extended to Panadure on the Coast Line and to Ragama on the Main Line.

In view of present experience of the maintenance of this system, the question of electrically blocking the remaining sections of the line by some other type of instrument is under consideration.

Interruptions.

Postal.—The total number of interruptions of the Postal-Telegraph Service during the year was 387, against 510 in 1901; this is satisfactory. The average duration per interruption is however higher, and is due in the main to the long interruptions mentioned below and to a few others of a similar nature. The average length of interruption in 1902 was 9 hours and 29 minutes, against 6 hours and 28 minutes in 1901:—

Date.	Duration. H.	M.	Section.	Remarks. Railway or Postal, and Cause.
January 4	52	25	Batticaloa-Kalmunai	(Postal) Flood
„ 8	36	15	Mannar-Jaffna	(Postal) Flood and elephants
„ 25	51	10	Colombo-Polgahawela	(Postal) Malicious injury
February 22	50	0	Dambulla-Matale	(Postal) Dambulla office fault
April 28	45	20	Colombo-Kandy	(Postal) Main and Nuwara Eliya direct. Fault passed by lineman
August 1	69	45	Anuradhapura-Trincomalee	(Postal) Fault passed by lineman
September 22	68	45	Chavakachcheri-Pallai	(Railway) Fault in office, which had been closed and instruments left in place
„ 30	61	0	Anuradhapura-Trincomalee	(Postal) Shackles broken. Lineman had not sufficient materials with him to effect repairs
November 16	38	15	Colombo-Avisawella	(Postal and Railway) Malicious injury

The record for the last eight years is given below:—

Year.	Number of Interruptions.	Aggregate Duration. Hours.	Average Duration. H.M.	Mileage of Wire in Use.	Average Time of Interruption per Mile of Wire. H.M.
1895	226	2,124	9.20	1,344	1. 6
1896	206	2,162	10.30	1,493	1.45
1897	136	1,590	11.34	1,592	1. 0
1898	146	1,747	11.58	1,653	1. 5
1899	218	1,666	7.38	1,683	0.59
1900	321	3,388	10.33	2,071	1.38
1901	510	4,286	8.24	2,091	2. 3
1902	387	3,670	9.29	2,124	1.43

Railway.—The total number of interruptions recorded in 1902 was 268 as against 259 in 1901; the total duration was 1,733 hours against 2,498 hours; and the average, 6 hours 28 minutes against 9 hours 38 minutes.

Similar figures for the last few years are appended :—

Year.	Total Number of Interruptions.	Aggregate Duration.	Average Duration.	Mileage of Wire in use.	Average Duration per Mile of Wire.
		Hours.	H. M.		H. M.
1895	120	819	6.50	349	2. 3
1896	162	1,385	6.30	376	3. 7
1897	132	1,173	8.52	376	3.12
1898	120	1,205	10. 2	376	3. 2
1899	115	805	7. 0	376	2.14
1900	162	1,761	10.52	376	4.41
1901	259	2,498	9.38	400	6.14
1902	268*	1,733*	6.28*	491*	3.31*

* Not including Tyer's Tablet System.

Technical Arrangements.

The Colombo-Nuwara Eliya circuit was converted from simplex to duplex and fitted with Wheatstone automatic apparatus. These are the first fast speed instruments that have been permanently set up in Ceylon, though a set was borrowed at the time of the Royal visit in 1901 for use between Colombo and Kandy. The traffic between Colombo and Nuwara Eliya is not sufficient to keep these instruments in constant use, but they have on several occasions proved useful when there has been pressure on the line. The staffs of the two offices are now becoming fairly used to the apparatus, but they have still much to learn.

The Colombo-Kandy circuit has also been converted from simplex to duplex; as this was only done on the 31st December, however, its effect on the average speed of telegrams is not shown in the return given in this report.

The Railway Coast line worked, as usual, very unsatisfactorily during the monsoons, and the experiment was tried in one section, apparently with some success, of putting six block Leclanche batteries in place of the minotto cells in general use. The change, however, was made after the worst of the weather was over, and the decision as to whether the use of this form of battery should be extended or not must wait until the south-west monsoon breaks.

Map.—A map of the arrangement of the circuits in the Island was published during the year.

Traffic.

Inland.—The actual statistics of the traffic for the year will be supplied by the Accountant's Branch, a perusal of them will show that there has been practically no increase over last year. What increase in traffic there has been is principally in the inland paid telegrams. The decrease has been mainly in the Indo-Ceylon and the inland free messages.

The period over which these statistics are compiled is from October, 1901, to October, 1902, and the trade depression during the end of 1901 and beginning of 1902 doubtless accounts for the traffic not showing the usual increase.

It is notable that while 34 offices out of 83 show a slight decrease in the number of messages sent in 1902, this decrease has taken place entirely in the southern and central parts of the Island, Batticaloa being the only office north of Matale which shows a reduction.

I give below a schedule of the number of messages booked at each of the twelve heaviest offices in the Island for the years 1896, 1898, and 1902, which shows the great increase that has taken place since the introduction of the 25-cent telegram in 1897 :—

	1896.	1898.	1902.
Colombo	62,809	100,196	134,506
Jaffna	9,173	23,142	29,541
Kandy	10,176	23,432	28,178
Galle	10,414	19,024	23,208
Nuwara Eliya	4,937	10,920	13,850
Batticaloa	4,436	12,467	13,739
Trincomalee	4,156	9,420	10,887
Kurunegala	1,775	6,287	8,815
Courts	1,976	6,569	8,560
Negombo	2,357	5,780	8,251
Hatton	4,808	7,787	8,153
Slave Island	3,260	7,072	7,777
Maradana	2,054	6,685	7,747
Matale	2,749	7,182	7,602

The figures given do not show the transit work of these offices; if a schedule were prepared showing the latter, Nuwara Eliya would be found to be the second most important office as regards amount of work performed.

In my last report I drew attention to the great increase in the number of urgent free State telegrams, and suggested that Heads of Departments should take certain steps to reduce the tendency shown to unnecessarily classing free telegrams as urgent to the detriment of the paid private message. This year there has been a slight reduction in the number of both urgent and ordinary free State messages. A comparison between the relative number of urgent and ordinary paid and free telegrams is interesting.

A reference to the statistics will show that while the ratio of urgent to ordinary paid private and paid State telegrams is respectively roughly 7 per cent. and 13 per cent. only, in the case of the *free* State telegram it is 100 per cent. Further comment is unnecessary.

A point worth noticing in the traffic returns of recent years is the gradual reduction of the proportion of urgent to ordinary paid telegrams. This is a satisfactory feature, as it goes to prove that the ordinary telegram is becoming more efficient, and I hope that it will soon be possible to do away with the urgent class altogether.

Except after a prolonged interruption, or when there is exceptionally heavy traffic, there is now very little difference between the speed of transmission of urgent and ordinary telegrams.

Delay in Transmission.

I had the delay worked out for the 24th November last (a fairly typical day with three short interruptions), and found that the average time occupied by a telegram in transit from any office

in the Island to Colombo on that day was 21½ minutes (48 per cent. being under 15 minutes) and from any one office to any other 28½ minutes.

I give below in tabular form similar figures for such previous years as they have been recorded. The improvement shown will, I think, be considered satisfactory :—

Year.	Average Time in Transit from any Office to any other in Ceylon. Minutes.	Average Time in Transit from any Office to Colombo. Minutes.
1895	87	56
1896	96	42
1897	52	46
1898	41	22½
1899	35	28
1900	No record taken	—
1901	do.	—
1902	28½	21½

Delivery.

The delay in delivery still remains unsatisfactory, though considerable improvement is shown, especially in Colombo, owing to the use of bicycles and the extension of their use to the important outstations is advisable.

Foreign Traffic.

The reduction of the rates on telegrams to Europe about the middle of the telegraph year has not, up to the present, resulted in the increase that was expected, the number for 1902 being only about the usual 10 per cent. above that of the previous year; this, however, is probably largely due to the depression in trade in the early part of the year, and better results may be looked for in the future.

Indo-Ceylon Traffic.

This shows a reduction, due probably to the same causes as those mentioned above. The existing wire to India is now carrying approximately the maximum number of messages per day allowed by the International Convention with the present system of working, and the erection of an additional line *viâ* the Kurunegala-Anuradhapura railway route to carry the overflow traffic and to act as an alternative route in the event of a breakdown is under consideration, as is also the question of extending Wheatstone automatic working to this circuit.

Revenue.

Owing to the maintenance of the Railway Telegraph System being now carried out for that Department free of charge, in order to avoid the creation of fictitious Colonial Revenue, the telegraph revenue shows a slight reduction. This and the traffic figures will doubtless be more fully dealt with by the Postmaster-General when he has the full statistics before him.

Telephone Branch.

The year 1902 has seen the completion of the doubling of the telephone wires, all telephones being now on metallic circuits, and except for a few minor details the work is complete. The difficulties which have caused the protracted delay have been fully dealt with in previous reports.

The service is now, I believe, giving greater satisfaction, and this is borne out by the extensions asked for and by the considerable increase in the number of calls.

The maintenance, which owing to press of other work has had to be rather neglected lately, is now being attended to, and arrangements have been made for the local repair of telephones in the Government Factory.

Complaints.

The number of complaints recorded in 1902 was 486, as against 445 in 1901, the increase being due for the most part to the larger number of subscribers and to the bad weather during the closing part of the year. These complaints include interruptions due to faults on the lines caused by the operations of workmen, to inattention on the part of the operators in the Exchange, and to fuses burnt out by lightning.

Renters are apt to ascribe all faults to the instruments, and complain that the latter are out of date, though as a matter of fact the majority are due to line faults, and the instruments are the same as those in use by the majority of Exchanges at home.

In a large number of cases no faults were found, the instruments and lines being found by the Inspectors to be in perfect order.

Revenue.

The revenue derived from the Telephone Branch since it was taken over by Government in 1896 is :—

	Rs. c.		Rs. c.
In 1896	13,187 73	In 1900	16,387 0
1897	16,274 10	1901	17,909 94
1898	16,635 82	1902	17,782 65
1899	16,045 7		

From 1899 no rental was received for lines and instruments used for Government purposes. The slight drop in 1902 is due mainly to the reduction in the number of lines and instruments found necessary at the Boer prisoners' camps and to one or two firms reducing the length of their lines.

Profits.

The profit on the year's working is Rs. 5,249·14, being 3·57 per cent. on the capital, Rs. 139,633·95, a fairly satisfactory result considering the heavy capital charges incurred for material taken over from the old Telephone Company, much of which has had to be scrapped.

Calls on the Exchange.

These were 109,465 in 1902, as against 76,090 in 1901, an increase of 33,375, or nearly 50 per cent.

* Including railway line and outstation lines omitted in previous records.

In conclusion, I have to express my appreciation of the able and willing manner in which my staff has helped me to extend, maintain, and I hope improve, the telegraph service during what has been a very arduous year.

Colombo, May 1, 1903.

D. MONTAGU, A.M.I.C.E.,
Superintendent of Telegraphs and Electrician in Ceylon.

POST AND TELEGRAPH LIBRARY AND RECREATION CLUB REPORT FOR THE YEAR ENDED 31ST DECEMBER, 1902.

YOUR Committee beg to submit their Report for 1902,

Members.—The number of members on 31st December, 1902, was—Colombo 244 and outstations 93, total 337; an increase on the previous year of 5 members.

Committee Meetings.—Nine Committee Meetings were held, with an average attendance of 9 members.

Subscriptions.—The total amount collected as subscription was Rs. 1,770·75, against Rs. 1,695·74 of the previous year.

Papers.—The following papers, magazines, and journals are subscribed for :—

Local : Observer, Times, Independent, Standard, Catholic Messenger.

Overland : Black and White, Sketch, Illustrated London News, Penny Illustrated Paper, Graphic, Ally Sloper, Scraps, Tit-Bits, Answers, Moonshine, Punch, Overland Mail, Pick-me-up, Pearson's Weekly, Crampton's Magazine, Windsor Magazine, Strand Magazine, Pearson's Magazine, English Illustrated Magazine, Review of Reviews, Woman at Home, Boys' Own Paper, Idler, Leisure Hour, London Reader, Family Herald, London Journal, Myra's Journal, Weldon's Journal, Young Ladies' Journal, and Chamber's Journal.

Our thanks are again tendered to the editors of the Observer, Times, Independent, Standard, Catholic Messenger, Daily News, Sandaresa, Sihala Samaya, and Dinakaraprakasa for continuing to supply us with copies of their papers free of charge.

Books.—A sum of Rs. 110·05 was paid during the year on account of new books. A copy of the "Life of Rowland Hill and the History of Penny Postage" was presented to the Club by Mr. Fox, to whom our best thanks are due. There were 1,574 books in the Library on 31st December, 1902, against 1,505 in 1901.

Lawn Tennis.—Considerable interest has been taken in this game. The court has been greatly improved. The old bamboo fence has been replaced on two sides by wire netting, and garden seats have been provided.

Cricket.—An effort was made to revive this game, but unfortunately without success. An application was first made for a piece of ground behind the Fort police station, but the ground offered was found not suitable. Application was afterwards made to join the Fort Cricket Association, but this too fell through, as the Association had received notice that their ground would be required for the new drainage scheme.

At Home.—An "At Home" open to members and their families was held on the 27th December, 1902, on the tennis court, and proved a great success, the Christmas tree especially being a source of much attraction to the children.

Reserve Fund.—A sum of Rs. 100 was, as usual, transferred to this Fund. The balance in the hands of the Treasurer on 31st December, 1902, was Rs. 1,116·88.

Receipts and Expenditure.—The Treasurer submits his balance sheet duly audited, and also his estimates for the current year.

Resignation.—Your Committee now beg to tender their resignation, and it is for you to elect new office-bearers.

By order of the Committee,
J. ROBERTSON,
Honorary Secretary.

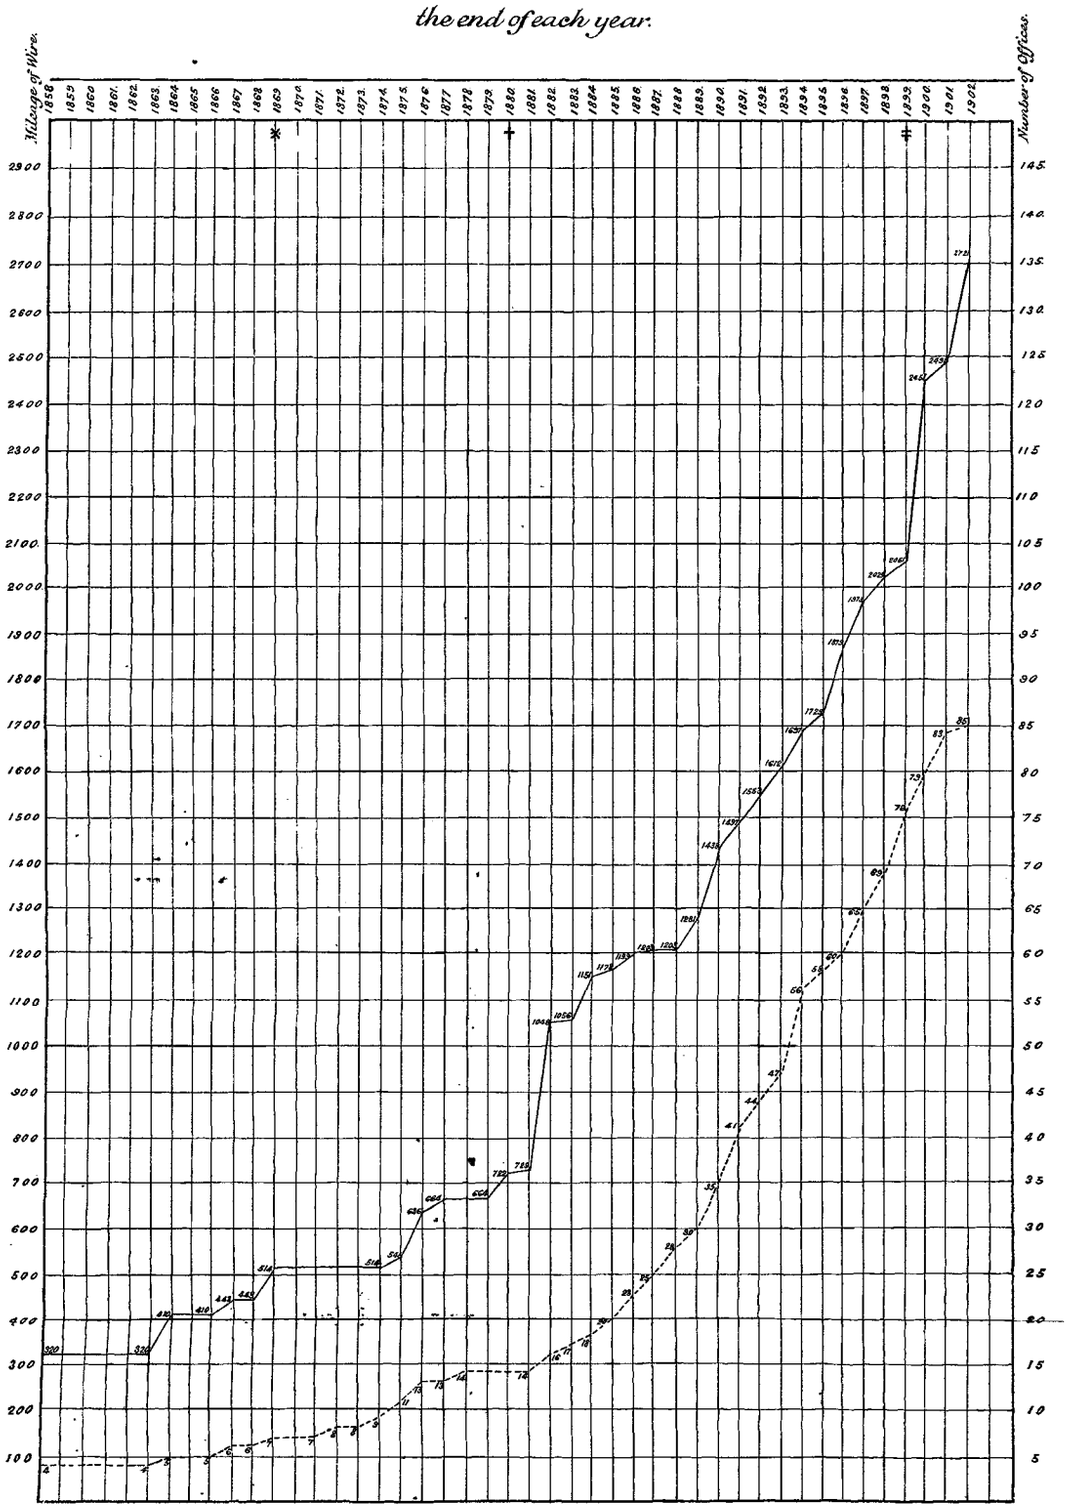
Curves showing the total Mileage of Postal and Railway Telegraph Wire in use at the end of each year since the opening of the first Telegraph Office in Ceylon in 1858; also the Number of Postal Telegraph Offices open at the end of each year.



——— Mileage.

- - - - - - - - Number of Offices

N. B. The accuracy of the earlier portion of the Mileage Curve is doubtful. It is thought that the Mileage of Railway Telegraph Wire was sometimes included and sometimes omitted in the early records.

* Jan: 1869 - System transferred from Ceylon to Indian Government.

† July 1880 - System re-transferred to Ceylon Government.

‡ The distribution return of Lines was revised in 1900 when it was found that the mileage as given previously was incorrect, some lines being omitted. The actual increase in 1900 was 269 miles.

Lith. S.G.O., Colombo. No. 2150.

RAILWAY.

REPORT OF THE GENERAL MANAGER FOR 1902.

I HAVE the honour to submit my report on the working of the Ceylon Government Railway for the year 1902.

The principal events to be recorded are the opening of the first sections of the Northern extension from Kankesanturai to Chavakachcheri and Pallai respectively in March and September, and a portion of the Kelani Valley line from Maradana to Avisawella in the latter month.

The opening of the section in the Jaffna Peninsula has undoubtedly been a boon to the inhabitants of the district, but it can hardly be expected that the receipts therefrom can at the present time be profitable in view of the competition of carts for the short distance traffic, which is thereby conveyed direct from market to boutique without transfer. Every inducement has been given to traders to use the railway by the introduction of a temporarily reduced goods rate, but they have not seen their way to take advantage of it to any extent. I trust that when the line is opened throughout to Kurunegala an improved state of affairs will be apparent, but a question that requires early attention is that of ascertaining in what direction the new country to be opened up is capable of development, so as to bring traffic on to the railway and consequently increased revenue to Government. From a purely Railway point of view the provision of new irrigation works and the resulting increase in paddy cultivation does not mean increased receipts, as the crops will probably be locally consumed, and this will have a tendency to check the importation of rice, which is an item of profit to the Railway.

The Kelani Valley line has started well, and has fulfilled expectations. The passenger traffic has been heavier than was expected; so much so, that the question of providing more passenger rolling stock is one for the near future. The goods traffic is also as good as might be expected in view of the fact that we have not yet reached the larger portion of the tea-producing country. I feel sure that when the Yatiyantota section is completed the goods traffic will fully realize expectations.

The introduction of the new train service on 1st May, though it meant a considerable increase in mileage and working expenses, has had a beneficial result in reducing the congestion in the Colombo suburban traffic, and generally improving the train service throughout the system.

Steady progress has also been made in carrying out the sanctioned increases in the rolling stock, and, at present, the Locomotive Engineer's hands are full in building and preparing for the vehicles for the Northern and Uda Pussellawa lines; but a further increase in rolling stock is inevitable before long, both to provide a reasonable reserve for repairs and cleaning, and also to replace the more or less obsolete four-wheeled carriages which have been running so long. All new stock will in future be constructed strictly to standard.

The Railway Stores were taken over by the Department at the beginning of the year, and a new system of control, based on standard railway lines, has been introduced, whilst the whole stock is gradually being verified. The accommodation available for the Railway Stores is extremely limited, and therefore great difficulty is experienced in carrying out the work satisfactorily.

The question of the provision of quarters for the large staff of Drivers and Guards stationed in Colombo has also made steady progress, and a site has been secured at Mount Mary, on which it is proposed to erect a number of bungalows in the ensuing year.

The exceptionally severe weather experienced at the commencement of the south-west monsoon tried the railway severely, and resulted in very serious slips at Wattegama and Haputale, with minor mishaps at a number of other places. Owing to the prolonged and heavy rainfall, it was considered advisable to discontinue the running of the Night Mail trains from 24th November to 7th December.

I regret to have to record three somewhat serious accidents, which are referred to in detail in the Traffic Superintendent's report. Fortunately there was no loss of life or injury to persons in connection therewith.

As appendices to this report are the departmental reports for the year furnished me by the Engineer of Ways and Works, the Locomotive Engineer, the Traffic Superintendent, and the Accountant.

CAPITAL ACCOUNT.

The original capital cost of open lines is approximately Rs. 58,556,733, the increase over 1901 of Rs. 5,466,629 representing the proportion of the outlay on the sections of the Northern and Kelani Valley Extensions, which were opened for traffic during the year. The total cost of the Railway, including additions and improvements up to the 31st December, 1902, has been Rs. 63,436,712, but this does not include the sum of Rs. 3,097,266 spent during the last six years on new works and rolling stock, which has been paid out of revenue.

LOAN ACCOUNT.

On the 1st January, 1902, the capital outstanding on loans (sterling debts converted into local currency at the rate of 1*s.* 4*d.* per rupee) was Rs. 32,067,372, or Rs. 162,238 less than on the 1st January, 1901. This does not include the capital raised for the Northern and Kelani Valley Extensions, portions of which are still under construction.

RESULT OF THE YEAR'S WORKING.

	1901. Rs.	1902 Rs.	Increase. Rs.	Decrease. Rs.
Gross Receipts ...	7,938,131	7,975,506	37,375	—
Working Expenses ...	4,736,701	4,907,101	170,400	—
Profit ...	3,201,430	3,068,405	—	133,025

Interest.—The interest on loans amounted to Rs. 1,493,082, but of this sum half the interest paid on the loan of Rs. 1,400,000 raised for the construction of the Northern, Kelani Valley, and Uda Pussellawa lines, and quarters for Railway Guards (namely, Rs. 127,417) has been charged to the cost of raising the loan, thereby making the nett amount of interest chargeable to revenue Rs. 1,365,665, being an increase of Rs. 130,487 over 1901.

Nett Earnings—After deducting the working expenses and the payment of the interest and sinking fund, the nett amount contributed by the Railway to the general revenue of the Colony amounted to Rs. 1,363,155. In previous years the amount due to sinking fund has not been deducted under this heading, but I consider that it certainly should, and I have so shown it.

Percentage of Expenditure to Gross Receipts.

	1901.	1902.	Increase.	Decrease.
Maintenance of Ways and Works ...	15·7	11·9	—	3·8
Locomotive	24·7	25·6	·9	—
Traffic	10·4	11·0	·6	—
General	1·8	1·9	·1	—
Special Expenditure (Deposit Stocking Account)	—	1·8	1·8	—
New Works	7·0	9·3	2·3	—
Total ...	59·6	61·5	Nett 1·9	—

Maintenance.—Under this head a large decrease of Rs. 301,194 is shown, owing to the expenditure on the renewal of the permanent way having been very heavy in the preceding year. The cost of maintenance of stations and buildings has been greater by Rs. 7,962, whilst slight increases are also shown in general superintendence, repairs to bridges, and sundry expenses.

Steady progress has been made throughout the year in improving the condition of the permanent way, and I hope that by the end of 1904 the road will be in a thoroughly satisfactory condition. The greatest difficulty we have to contend with is the provision of a suitable sleeper that will withstand the attacks of dry rot and ants, and, so far, the best we have been able to obtain in any quantities have been Australian jarrah and English creosoted Baltic fir (the latter for use with the lighter rail.) Unfortunately both these have to be imported, and consequently a certain proportion of the cost represents shipping, inspection, and other charges. The question of the cultivation of a suitable hardwood timber in the Island is one that would profitably repay the attention of the Forest Department. We now have in the road Ceylon satinwood sleepers that were laid when the line was opened to Kandy in 1867, and they are still in very fair condition, but unfortunately we have so far been unable to obtain these in any quantity. The "cast iron pot" sleeper is now used to a great extent in India, with apparently good results, and I propose to experiment with them in the near future. Australian karri has been tried, but has been found most unsuitable.

The question of ballast is having special consideration, and Government have sanctioned the provision in 1903 of a suitable stone crusher, which will greatly assist in improving the quality of the permanent way.

Mr. W. Cantrell, who had been in the service of the Railway since 1867, and who had ably filled the post of Engineer of Ways and Works for twenty-six years, retired on 5th August, 1902, on completion of the statutory age limit. By his departure Government lost a faithful servant, and his brother officers a true friend.

Locomotion.—The total increase of Rs. 80,335 in the cost of the Locomotive Department is actually due to the opening of the sections of the Northern and Kelani Valley Extensions. On other parts of the line the Locomotive Engineer has succeeded in materially reducing the expenditure in several directions, whilst the volume of work turned out of the worshops has been very much greater than during preceding years. The actual annual statistical figures as to the number of engines and carriages repaired do not convey an accurate idea of the extra work done during the year, but it may be taken as an undoubted fact that far more new materials and far better quality of work have been put into the rolling stock during 1902 than has ever previously been the case. Though this extra work may at first mean increased cost of materials, such as timber, paint, and varnish, it is only what is required to increase and maintain the efficiency of the stock, and it must result in future economy by preventing deterioration and decay.

In the Locomotive shops there has been a remarkable and creditable increase of efficiency, which is clearly exemplified by the fact that during the year, as compared with 1900, 200 per cent. more engine repairs have been carried out, and some Rs. 100,000 worth of new materials put into the engines, with practically the same expenditure on wages of workmen, and this though the plant and machinery in the Locomotive shops is practically the same as it was in 1900.

Economies have also been effected in other directions, as, for example, in the case of oil, tallow, and waste, where, though there has been an increase of 109,111 traffic engine miles, the expenditure has been reduced by Rs. 39,824, as compared with the previous year, whilst greater economy has also been obtained in the consumption of fuel, where there is a saving of about 1¾ lb. per engine mile, and a reduction of nearly 2½ lb. per train mile, representing a saving of some 1,500 tons of coal.

The growth of the Railway has particularly made itself felt in the Locomotive Department, where, with the accommodation it recently had, it was practically impossible to carry out the work efficiently. The remedy lay in increasing the accommodation and in providing labour-saving plant, which would enable more work to be turned out in a given time and given space, and Government has recognized this fact by granting an extension of the carriage shop, a steam carriage traverser for the same, and an installation of new wood-working machinery, all of which has had a most beneficial effect. They have also authorized for 1903 an extension of the machine shop and the provision of pneumatic and other new machinery for the Locomotive shops.

There is, however, another addition which is urgently required, namely, an extension of the Paint shop. We now have a separate Paint Shop Foreman, and far more attention is being given to the painting and varnishing of engines and stock than has been the case previously, but the work cannot be efficiently carried out for want of room. An extension of this shop can be provided at a reasonable cost, and it should be sanctioned early.

During the year the whole supervising and clerical staff of the Locomotive Department has been thoroughly re-organized and re-arranged so as to secure a maximum of efficiency with economy. I wish to bear testimony to the good and hard work performed by the Locomotive Engineer and his officers, which has resulted in such an improvement in the organization and output of this department.

Mr. Nicol, the head of the Carriage Department under the Locomotive Engineer, retired during the year after twenty-three years of able service.

Traffic.—In this Department also the increased expenditure has been chiefly in working the newly opened extensions.

The principal increases shown are in traffic charges, namely, Rs, 27,863 on account of salaries and wages, Rs. 2,894 in clothing, Rs. 4,246 in stores and stationery, Rs. 17,410 for running charges (*i.e.*, wages of guards), and Rs. 4,762 for maintenance of Tyer's Tablet System. Against these increases there is a decrease of Rs. 17,583 under the head of Telegraph Charges, the cost of maintenance being borne by the Postmaster-General's Department in 1902.

There was an increase during the year in the number of relief clerks, whilst two additional posts of relieving station masters were filled to enable the Railway to make better arrangements for providing for temporary vacancies caused by sickness amongst the station masters and station clerks or during their absence on leave.

General Charges.—The increase of Rs. 12,177 under this head is due partly to the opening of the extensions and partly to the cost of verification and re-arrangement of the Railway Stores, taken over by the Department at the beginning of the year.

Special Expenditure.—A heavy item of Rs. 139,989 under this heading was incurred to adjust and increase the Deposit Stocking Account, in order to provide sufficient funds for payment for permanent way materials owing to increased requirements consequent on the expansion of the Railway System year by year.

NEW WORKS.

The expenditure under this head was considerable, amounting to Rs. 745,783, or Rs. 193,478 more than in the preceding year. The following are the more important items, viz.:—

	Rs.
Improvements to Slave Island station	128,727
Additional and improved accommodation at Nanu-oya	29,978
Extension of goods shed at Hatton	13,108
Completion of retaining wall at Nawalapitiya...	4,366
New goods shed at Ukuwela	2,693
Interlocking of points and signals at roadside stations	17,043
Passing siding at Angulana	3,952
Extension of new telegraph line from Ambalangoda to Galle	13,218
Reconstruction of Getambe viaduct	21,555
New bungalows for staff at Bandarawela, Talawakele, Hatton, Nawalapitiya, Peradeniya Junction	32,968
Fitting existing stock with vacuum brake	19,796
Cementing platforms at Coast Line stations	2,047
New machinery	21,140
New station building at Pattipola	7,303
Two new engines	102,809
New passenger carriages	115,652
New goods wagons	118,293
Tyer's Tablet System	27,127
Improvements to Railway Stores	4,636
Improved lavatory accommodation	15,230
Lines for Railway Staff	10,533

The improvements at Slave Island station have to a considerable extent relieved the congestion on the Sea Coast Line, but the doubling of this section is a question that must inevitably be faced before long. The line is so crowded that punctual working is almost an impossibility.

It will be seen that steady progress has also been made with the important works of interlocking points and signals, fitting rolling stock with vacuum brake, and installing Tyer's Electric Tablet System, items which all tend to increase the efficiency and safety of the Railway.

Two new engines for Main Line traffic have also been received and erected during the year.

MILEAGE.

Length of Line.—The total length of line open for traffic at the end of the year was 368½ miles, viz., broad gauge 331⅝ and narrow gauge 36⅞, the increase over the preceding year being 71⅜ by the opening of the section of the Northern Extension from Kankesanturai to Chavakachcheri, 20¾ miles, on the 11th March, and thence to Pallai, 15¾ miles, on the 15th September; also by the opening of the first section of the Kelani Valley Extension on the 2 ft. 6 in. gauge from Colombo to Avisawella, 36⅞ miles, on the 15th September. The average mileage open for the year was 328⅜ miles.

Traffic Train Mileage.

	1901.	1902.	Increase.	Decrease.
Coast Line ...	451,353	476,205	24,852	—
Main Line ...	558,776	568,601	9,825	—
Nawalapitiya-Nanu-oya Section	176,937	173,349	—	3,588
Nanu-oya-Bandarawela Section	74,865	73,662	—	1,203
Matale Branch ...	50,692	49,748	—	944
Kurunegala Branch ...	19,486	19,362	—	124
Northern Section ...	—	28,593	28,593	—
Kelani Valley Section ...	—	24,820	24,820	—
Total ...	1,332,109	1,414,340	Nett 82,231	

The increased mileage on the Coast and Main Lines is due to the new train service, which was brought into operation in May. The decrease on the Matale Line is due to a reduction in the number of Sunday trains from the same date. The reduction on the Nanu-oya–Bandarawela Lines is owing to fewer special goods trains having been run last year, due to falling off in goods traffic over those sections.

The nett increase in mileage, exclusive of the extensions, is 28,818 miles.

Comparative Statement of the Number of Periodical Tickets issued in 1901 and 1902 and the Receipts therefrom (all Tickets reduced to Monthly Tickets).

1901.	1902.	Increase.	Decrease.	Class.	1901.	1902.	Increase.	Decrease.
No.	No.	No.	No.		Rs.	Rs.	Rs.	Rs.
498	517	19	—	First Class ...	3,894	3,926	32	—
8,555	9,507	952	—	Second Class...	18,667	21,421	2,754	—
24,791	26,461	1,670	—	Third Class ...	60,629	65,132	4,503	—
33,844	36,485	2,641	—		83,190	90,479	7,289	—

The decrease in the ordinary passenger traffic on the Coast Line is almost entirely due to increased number of season ticket-holders, but it will be observed that whilst the receipts from ordinary passengers show a falling off to the extent of over Rs. 30,000, the total revenue from season tickets shows an increase of only Rs. 7,289.

On the Main Line the anomaly of a decrease of Rs. 7,284 in ordinary receipts, despite an increase of 15,109 in the number of passengers carried, is explained by the fact that whilst the number of passengers travelling short distances from roadside stations to Colombo and Kandy has increased considerably, fewer pilgrims have travelled between Colombo and Kandy.

On the Nanu-oya and Bandarawela sections of the line the decreases were general both in through bookings with other sections and in local bookings. At Hatton there was a decrease of 9,172 in the number of passengers booked, whilst the receipts were practically the same.

The Matale Line again shows a large decrease, and this can only be attributed to fewer pilgrims visiting the Buddhist temple at Kandy.

The increase of 2,641 monthly season tickets represents an increase of 132,050 passenger journeys, assuming that each season ticket-holder travels only once each way on week days, but, as a matter of fact, very many use their tickets on Sundays also, so that the work done by the Railway Department has really been greater than in the preceding year, notwithstanding the decrease above referred to in the number of ordinary passengers carried.

In second class season tickets the increase has been fairly distributed between suburban stations, Kelaniya to Mount Lavinia inclusive, but the increase in third class tickets has been contributed principally by Wellawatta and Mount Lavinia. In the case of the latter station the increase is due to a reduction in the rate, consequent on the placing of it in a separate zone from November, 1901, instead of including it in the Moratuwa zone, which has induced a larger number of people to take season tickets from Mount Lavinia.

Parcels and other Coaching Traffic.

	1901.	1902.	Increase.	Decrease.
	Rs.	Rs.	Rs.	Rs.
Parcels	163,530	174,028	10,498	—
Mails	54,825	56,538	1,713	—
Horses	16,163	15,918	—	245
Carriages	7,401	6,316	—	1,085
Dogs, &c.	5,879	5,038	—	841
Bicycles	7,374	7,569	195	—
Private Special Trains	19,662	18,719	—	943
	274,834	284,126	Nett 9,292	—

Parcels.—The increase in parcels receipts is almost the same as the increase in 1901 over 1900, but the Railway has performed nearly three times as much work in 1902, the number of additional parcels carried being 54,315, whereas the same amount of increase was earned in 1901 by the transport of only 20,950 parcels in excess of the number carried in 1900. This is accounted for by the fact that whilst there has been a considerable falling off in the number of long distance parcels received at Colombo, especially in vegetables, fruit, and flowers (the decrease in the number forwarded from Nanu-oya alone being 2,500), there has been a large increase in the number of short distance parcels on the Coast Line, principally in fish traffic to Colombo and in general parcels from Colombo.

At Pettah station alone 12,000 inwards and 10,000 outwards parcels were dealt with in excess of the number received and despatched in 1901; Slave Island also shows an increase of 3,500 inwards and 8,000 outwards, the other principal increases being at Moratuwa 3,000 forwarded, Kalutara South 1,500 forwarded, Galle 4,700 received, and Matara 7,000 forwarded and 3,600 received. Only 4,100 parcels were conveyed over the Northern Extension, although the section from Kankesanturai to Chavakachcheri was open 9½ months, whereas 5,000 were received and upwards of 2,000 forwarded from stations on the Kelani Valley line during the short period of 3½ months that the line was open for traffic.

Horse, Cattle, and Dog Traffic.—A small decrease is again shown in the number of horses conveyed, the principal reductions in the receipts being at Hatton, Bandarawela, Kalutara South, Galle, and Matara. Of the decrease of Rs. 1,085 in carriages, Colombo accounts for Rs. 600, Bandarawela Rs. 340, and Galle Rs. 150.

The increase of Rs. 195 in bicycles was earned by the conveyance of 522 additional machines.

The decrease in special trains has been fairly divided between the Coast and Main Lines, the former showing Rs. 397 and the latter Rs. 462.

Total ...	520,547	4,731,841	518,757	4,752,608	— Nett 20,767		1,790	(Nett)

Deducting Railway material for open lines which is conveyed free of charge, and material for Railway Extensions which is carried at a very low rate, also stone traffic for the Harbour Works which is transported only a short distance at less than the ordinary rates, the general goods traffic shows an increase of 20,352 tons and Rs. 41,230, including the Northern and Kelani Valley Extensions.

Rice.—The decrease of Rs. 35,901 in the receipts, in the face of an increase of 3,027 in the tonnage, is due to a large quantity of rice having been transported over short distances, particularly on the Coast Line from Galle to Matara and Ambalangoda and on the Kelani Valley Line. On the other hand, a smaller quantity was despatched from Colombo and Wharf to up-country stations.

Tea.—The increase of 3,929 tons brings the traffic under this head up to practically the same amount as was conveyed in 1900, the decrease in 1901 under the preceding year being 3,879 tons. The improvement has been general throughout the planting districts, except from stations between Watawala and Talawakele inclusive, where decreases to a total of 917 tons are shown. The principal increases were at Kandy and Peradeniya 929 tons, on the Matale Line 490 tons, Gampola and Nawalapitiya 490 tons, Haputale 430 tons, and Bandarawela 600 tons. During the 3½ months the Kelani Valley Line was open for traffic it contributed 855 tons of tea, but the distance being short the freight paid thereon amounted only to Rs. 3,921.

Coffee.—A small increase in the quantity of coffee conveyed is chiefly in the imported article for up-country consumption, the amount despatched from Colombo being 80 tons in excess of that in 1901. Slight increases are shown as having been consigned from Kandy, Matale, and Haputale, whilst there has been a decrease of 50 tons at Bandarawela.

Cacao.—Of the increase of 643 tons, Kandy accounts for 330 tons, the remainder being contributed by stations on the Matale Line, Kadugannawa, and Kurunegala.

Cocoanut Produce.—The increase of 2,805 tons is chiefly in copperah. Main Line stations, Henaratgoda to Alawwa inclusive, account for 1,875 additional tons; Coast Line stations, Alutgama to Matara, about 300 tons; and the Jaffna District 850 tons.

Fruit, Vegetables, and other Fifth Class Goods.—The principal increases were at Polgahawela 385 tons, Kurunegala 85 tons, Rambukkana 143 tons, Kadugannawa and Kandy 247 tons, and Matara 142 tons.

Plumbago.—A slight improvement in this industry is shown by an increase of 2,329 tons, to which Kurunegala contributed 1,150 and Galle 1,250 tons. Slight decreases at other stations were counterbalanced by an increase of 700 tons at Mirigama.

Tea Packing.—The increase of 1,205 tons was a natural adjunct to the increase in the quantity of tea transported.

Tobacco.—The principal increases were at Kandy 137 tons, Matale 95 tons, Kurunegala 32 tons, whilst the Northern Extension accounted for 190 tons.

Timber.—The increase of 1,341 tons shown under this head does not represent any actual increase of traffic. It is due to the firewood conveyed from the forests between Nanu-oya and Ohiya in previous years having been shown under the head of "Other 6th Class Goods," whereas in 1902 it has been classified under the head of "Timber." As a matter of fact, there has really been a decrease in the quantity of firewood despatched from this district.

Manure.—Of the total quantity of manure carried in 1902, 5,585 tons were conveyed only from Wharf and Colombo to the Kelaniya Manure Works, so that the actual increase in the quantity transported to other parts of the line amounted only to 1,266 tons.

General Goods.—The nett decrease in sundry goods is distributed under the following heads:—Arrack 401 tons, Salt 562 tons, and 3rd and 6th Class Goods other than those specially classified 472 and 4,095 tons respectively. Of the latter, over 3,000 tons is merely consequent on the transfer of firewood to the head of "Timber," as already mentioned above. Oil shows an increase of 720 tons, and shop goods, such as oilmanstores, furniture, &c., an increase of 420 tons. Many of the decreases under this head are largely due to the reduction in the number of the prisoners of war at Diyatalawa consequent on the conclusion of the war.

Railway Materials and Stone Traffic.—An increase of 3,219 tons in materials conveyed for the Railway Extensions is more than counterbalanced by a decrease of 4,185 tons in the transport of materials, principally rails and sleepers, for the open lines. The decrease of 21,184 tons of stone is entirely on account of the Harbour Works.

Live Stock.—There is a decrease of Rs. 7,740, which is due to a smaller number of cattle being conveyed to Diyatalawa owing to the gradual repatriation of the Boer prisoners on the conclusion of the war in South Africa.

Sectional Results.—The following table gives the results of the working of the several sections of the Railway in 1902 compared with 1901:—

	1901. Rs.	1902. Rs.	Increase. Rs.	Decrease. Rs.
Main Line: Colombo, Kandy, and Nawalapitiya (including Wharf and Mahara Quarry):

NOTES ON SECTIONAL RESULTS.

Main Line: Colombo to Kandy and Nawalapitiya.

Receipts.—The decrease of Rs. 7,284 in ordinary passenger traffic has already been explained in the general note on the passenger earnings. Reasons for the decrease of Rs. 12,940 in stone and Rs. 4,390 in live stock have also been given in the remarks on the general results. Small decreases are also shown in horse, cattle, and dog traffic, special trains, and miscellaneous receipts, the only increases being in goods Rs. 8,798, parcels Rs. 2,763, and season tickets Rs. 657.

Expenditure.—The decrease of Rs. 193,745 in maintenance charges by less re-laying than in 1901 is to a great extent discounted by an increase of Rs. 104,463 in new works and Rs. 44,306 in special expenditure in augmenting and adjusting the permanent way materials stocking account. The increase in new works is chiefly due to the provision of additional engines and rolling stock and the reconstruction of Getambe viaduct. A decrease of Rs. 8,196 is also shown under Telegraph Charges, owing to the Postal Telegraph Department having undertaken the cost of maintenance of the Railway Telegraph from the 1st January, 1902. Small increases in locomotive power and traffic charges are due to an increase of 9,825 miles in the train mileage.

Nawalapitiya-Nanuoya and Nanuoya-Bandarawela Sections.

In the actual working of the Railway the line from Nawalapitiya to Bandarawela is treated as one section, although for statistical purposes it has hitherto been divided into two sections; but as I do not see that any practical purpose is served by this subdivision, and as it entails considerable clerical labour, I purpose in these remarks and in my future reports to deal with it as one section.

Receipts.—The decrease in passenger receipts, as already stated, has been general throughout the district, and cannot be ascribed to any particular cause. The decreases in general goods, firewood, and live stock traffic are due to the reduction of the Diyatalawa Camp. There are also decreases in tea sent from stations Watawala to Talawakele inclusive, and in up traffic, such as rice and tea packing, for those districts.

Expenditure.—The table shows a decrease of Rs. 34,067 between Nawalapitiya and Nanu-oya whereas between Nanu-oya and Bandarawela there has been an increase of Rs. 32,946. This is chiefly due to considerably less re-laying of permanent way on the former section than in 1901 and to more extensive re-laying on the latter section. In new works also the outlay between Nanu-oya and Bandarawela was heavier than in the preceding year, consequent on the building of a new station (including residential accommodation for the Station Master) at Pattipola and to a portion of the cost of improvements at Nanu-oya being charged to this section, together with its proportion of the increase in the permanent way material stocking account. In Locomotive and Traffic charges small decreases on both sections are consequent on a reduction in the train mileage.

Coast Line.

Receipts.—The principal increases are goods Rs. 43,004, parcels Rs. 6,055, and season tickets Rs. 6,360, whilst in ordinary passenger traffic there has been a decrease of Rs. 30,018, due, as already explained, to the increase in the number of season ticket-holders.

Expenditure.—Increases of Rs. 44,980 in locomotive power and Rs. 11,286 in traffic expenditure are due to the train service having been improved to the extent of 24,825 additional train miles during the eight months May to December. The proportion of the increase in the permanent way material stocking account charged to this line is accountable for a increase of Rs. 46,663, and under the head of New Works the outlay has been greater by Rs. 82,836 than in 1901, the principal items being the improvements to Slave Island station and the provision of additional rolling stock. That the nett increase in expenditure is only Rs. 62,850 is due to the fact that the cost of maintenance of permanent way was less by Rs. 121,651 than in the preceding year, when extensive renewals of rails and sleepers were carried out.

Matale Line.

Receipts.—There is a decrease in passenger earnings of Rs. 8,518, and an increase in goods traffic of Rs. 1,717, chiefly in tea and cacao.

Expenditure.—It is with regret that I have to record again, after an interval of six years, that the expenditure for this section has exceeded the earnings, notwithstanding the fact that the locomotive expenses have been reduced by the running of one train less in each direction on Sundays since the revision of the train service in May. This is due to an increase of Rs. 19,085 in the cost of maintenance of permanent way and to the debit of Rs. 8,013 on account of the increase in the permanent way materials stocking account.

Kurunegala Line.

Receipts.—This is the only section of the line which shows an all-round increase in the earnings. The principal increases are in passengers Rs. 1,287 and in goods traffic Rs. 6,815.

Expenditure.—There is an increase of Rs. 4,000, principally in maintenance charges.

Northern Extension.

Receipts.—The principal item is Rs. 25,100 for passenger traffic, as the goods traffic only amounted to Rs. 3,180, whilst parcels, horses, cattle, and dogs, and miscellaneous traffic only accounted for about Rs. 800.

Expenditure.—The following are the principal amounts :—Maintenance Rs. 11,744, locomotive power Rs. 23,126, traffic charges Rs. 18,709, and carriages and wagons Rs. 2,288. The figure shown for locomotive power is low, owing to a bill for Rs. 8,414 not having been charged up to the end of the year.

Kelani Valley Section.

Receipts.—The following shows the distribution of receipts :—

	Rs.
Passengers	43,610
Parcels	1,040
Season tickets	183
Horses, cattle, and d	158
Goods	23,996
Miscellaneous	242

Expenditure.—The items under this heading are as follows :—

	Rs.
Maintenance	12,207
Locomotive power	15,819
Traffic charges	18,483
Carriages and wagons	4,947

In the case of coal on this section there was also an item of Rs. 1,238 not charged up to the end of the year.

G. P. GREENE,
General Manager.

General Manager's Office,
May 15, 1903.

CASUALTIES.

Loss of life or serious injury resulted to the following natives when trespassing on the Railway line in defiance of the special notices exhibited and in spite of the efforts of the patrols and others of the Railway Staff to prevent trespassing and to prosecute trespassers :—

January 8.—A child near Mount Lavinia.
January 18.—A man between Mount Lavinia and Dehiwala.
January 29.—A man near Kosgoda.
February 11.—A child between Katukurunda and Paiyagala north.
February 12.—A woman near Ambepussa.
February 20.—A woman between Beruwala and Maggona.
March 14.—A woman between Beruwala and Alutgama.
April 23.—A man between Ambalangoda and Hikkaduwa.
April 25.—A boy on Kalutara bridge.
May 17.—A man near Tellipally, Northern Railway.
June 19.—A woman and three children on Slave Island bridge.
July 13.—A man between Mirigama and Veyangoda.
July 17.—A man near Peradeniya Junction.
August 26.—A man between Ukuwela and Wattegama.
August 30.—A man between Hunupitiya and Ragama.
September 4.—A man at Katukurunda.
September 9.—A man between Wellawatta and Dehiwala.
September 15.—A woman between Angulana and Lunawa.
September 28.—A man on Northern Extension.
October 8.—A man between Waga and Kosgama.
October 15.—A woman between Kadigamuwa and Alagalla.
November 6.—A girl between Dodanduwa and Hikkaduwa.
November 12.—A man between Alutgama and Kosgoda.
November 16.—A girl near Ukuwela.
A man between Diyatalawa and Bandarawela.
December 4.—A man near Kelaniya.
December 10.—A boy between Kelaniya and Hunupitiya.
December 18.—A man between Henaratgoda and Veyangoda.
December 21.—A man on Panadure bridge.
December 22.—Mr. Clementi Smith, District Engineer, Public Works Department, Matale, was severely injured in attempting to enter a train in motion from Kandy to Matale.

Accidents to Members of the Railway Staff.

January 19.—Gateman Suppan found murdered in his gatehouse between Diyatalawa and Bandarawela.
February 6.—Engine cleaner Ranna run over and killed in Kandy yard.
July 10.—Under Guard Jansz met with an accident by falling off the footboard of the Down Mail near Nanu-oya.
August 4.—Patrol Pitchemuttu met with an accident in No. 3 tunnel.
August 28.—A Ways and Works cooly run over and killed in Kandy yard.
September 14.—Lampman Paron met with an accident by falling of a vehicle of a ballast train.
October 20.—A Ways and Works cooly run over between Ohiya and Haputale.
November 29.—Pointsman Packeer run over and killed in Nawalapitiya yard.

Calendar of Events.

January 1.—Railway Stores taken over from the Controller of Government Stores.

March 5.—Grand Dukes Kyrill and Bovil of Vladimivovitch travelled to Kandy.

March 11.—First section of the Northern Extension, Kankesanturai to Chavakachcheri, opened by His Excellency the Governor.

March 19.—Rockslip between Ballany and Kadugannawa, Up express delayed over two hours.

May 1.—New train service brought into operation.

May 1.—Mr. N. J. Price, District Locomotive Superintendent, appointed as Assistant Locomotive Engineer.

Earth and rock slip near Alagalla.

May 4.—Slip cleared and line re-opened for traffic.

May 5.—Departure of Mr. W. Cantrell, Engineer of Ways and Works, to England on three months' leave prior to retirement.

Departure to Australia on leave of absence of Mr. A. G. Perman, Traffic Superintendent.

May 12.—Collision between 11.35 A.M. Down Train from Kandy and a Down Ballast Special between Ambepussa and Mirigama.

August 3.—Departure to England on leave of absence of Mr. T. A. Wylie, Accountant.

August 5.—Mr. A. Paton Gray, Assistant Engineer, promoted to Engineer, Ways and Works.

August 7.—Engine and a few wagons of 5 P.M. train *ex* Matara derailed in Galle yard owing to wrong setting of points.

August 8.—Arrival of Mr. A. G. Perman, Traffic Superintendent, from leave of absence.

September 13.—Collision between 7.10 A.M. Down Train from Kandy and 7.35 A.M. Up Train from Colombo at Ambepussa station.

September 15.—Opening of second section of the Northern Extension, Chavakachcheri to Pallai.
Opening of first section of the Kelani Valley Extension, Colombo to Avisawella.

October 15.—New Railway Ordinance came into force.

November 11.—Serious landslip between Wattegama and Ukuwela, through traffic suspended.

November 21.—Subsidence of line between Haputale and Diyatalawa, through traffic suspended till 1st January, 1903.

November 25.—Line between Wattegama and Ukuwela re-opened to traffic.

REPORT OF THE RAILWAY ACCOUNTANT FOR 1902.

I HAVE the honour to forward herewith the usual tables giving details of the receipts, expenditure, and work done by the Railway (including particulars furnished by the Chief Resident Engineers of the capital outlay on the Northern, Uda Pussellawa, and Kelani Valley Extensions under construction) during the year ending 31st December, 1902.

Personal.—On the 3rd August I left Ceylon for England on six months' leave, and as on previous occasions Mr. E. H. Wade, the Assistant Traffic Superintendent, had charge of this Department during my absence.

Establishment.—The following additions to the staff of the Department have been made in the course of the year :—

Two junior clerks for the strengthening of the Check Office and one messenger for the Correspondence Branch ; two clerks (one each) for the Audit and Check Offices and one pay clerk for Jaffna on account of the opening of the Northern Extension ; seven clerks, viz., two for the Audit Branch, one Assistant Bookkeeper, two for the Check Office, one for the Correspondence Branch and one pay clerk, also one ticket counter, one ticket checker, and one messenger on account of the Kelani Valley Extension.

Office Accommodation.—In my report for 1901 I stated that it was almost a matter of impossibility to make room for any additional staff in the existing offices, and in order to provide for the work of the Northern and Kelani Valley Extensions it has consequently been found necessary to convert the building formerly used as a Railway School into a temporary office, in which the Statistical, Parcels, and Ticket Checking Branches are now located. This is doubtless the best temporary arrangement that could be made ; but it cannot be considered satisfactory, as supervision is necessarily restricted, and a good deal of time is lost in journeys between the two offices.

The school has been transferred to the clerks' tiffin room in the adjacent building, and the only place now available for upwards of 100 clerks, ticket checkers, and counters to take their meals is in the enclosed end verandah of the temporary office.

Expenditure.—The cost of working my Department for the year amounted to Rs. 92,611, an increase over 1901 of Rs. 12,612, details of which are given in Table No. 11. The principal increase is under the head of Salaries, due to the extra staff appointed consequent on the extensions of the line and to the ordinary annual increments of salary.

In comparison with other Railways, the total cost of the Accountant's Branch on this Railway will at first sight appear to be high, but this is entirely due to three causes, namely, to the cost of the Travelling Ticket Inspecting Staff and the expenditure on tickets, dating presses, &c., being charged to this Department instead of to the Traffic Department, and to a good deal of work being done in this office which on other Railways is dealt with in the office of the Secretary, Agent, or General Manager.

Financial Transactions.—A considerable increase to the work of the Audit, Bookkeeper's, and Cashier's Branches was brought about from the 1st January, 1902, by the transfer to Railway control of the Railway Stores, which had previously formed a Branch of the Colonial Stores Department. The receipts and payments made on account of the Stores Branch amounted to Rs. 4,281,280, thereby bringing up the total financial transactions of this Department to Rs. 17,452,505, or Rs. 4,475,016 in excess of the amount dealt with in 1901.

In the absence of a bank at Jaffna, the cash receipts and payments on account of the Northern Extension are being transacted through the local Kachcheri, the Government Agent of the Northern Province acting as Banker for the Railway until such time as the line is opened throughout and direct communication with Colombo is established.

Railway Stores and Materials.—The freight charges written off on permanent way material, coal, and other stores carried in traffic wagons for the Ways and Works and Locomotive Departments amounted to Rs. 147,756, or Rs. 11,322 less than in the preceding year, owing to less re-laying having been done by the Maintenance Department. This does not include firewood for the Locomotive Department, for the free transport of which traffic wagons and vans were run 207,276 miles during the year.

Ticket Irregularities.—There has been an increase of nearly 100 cases detected by the Travelling Ticket Inspector and his staff of persons travelling without proper tickets, the number being 1,593, as against 1,504 in 1901. Only 15 prosecutions were undertaken, and fines amounting to Rs. 127·50 were imposed. The amount of the excess fares recovered consequent on the discovery of irregularities by the travelling ticket examiners was Rs. 699·93, or Rs. 20·73 less than in the preceding year. As stated in my last report, I consider the present staff of one Inspector and two examiners insufficient to thoroughly patrol the whole line. On the Northern Extension the pay clerk performs the duties of a Travelling Ticket Inspector in addition to his ordinary duties.

Notes on Statistical Results shown in Table No. 1.

Coaching Vehicle Mileage and Earnings.—The large increase of 940,561 in the mileage run by coaching vehicles is distributed as under : Coast Line 349,815, Main Line 179,592, Nanu-oya and Bandarawela section 62,123, Northern Extension 187,251, and Kelani Valley Line 186,875 ; whilst the Matale and Kurunegala Branches show decreases of 12,078 and 13,018 respectively. The additional mileage on the Coast and Main Lines has been run in face of a decrease in the passenger receipts, for the purpose of giving an improved train service and increased accommodation ; and this, taken in conjunction with the small amount of the passenger traffic on the Northern Extension, has resulted in a decrease in the earnings per coaching vehicle per mile of nearly 1½ cent, viz., from cents 24·08 to 22·63.

Goods Vehicle Mileage and Earnings.—The slight decrease of 1,923 miles in the total mileage run by goods vehicles is brought about by a reduction of 131,223 miles in stone wagons worked to and from Mahara Quarry for the Harbour Works Department. In the mileage of ordinary goods wagons there has been a nett increase of 129,300 miles, due to an improvement in the Coast Line traffic; but whilst the earnings per goods vehicle per mile show a small increase of ·14 cents, the all-round earnings of the goods trucks in traffic were actually less by Rs. 307 per vehicle, partly owing to the small amount of work done by the trucks shipped to Jaffna for the Northern Extension, and partly to the average number of vehicles in traffic being 65 in excess of the number in the preceding year.

Average Load of Goods Vehicles.—The remarks in the preceding paragraph also explain the decrease in the tonnage hauled per goods vehicle of 1,895 tons. The average load per vehicle per trip of 3·522 tons is a slight improvement (·002 of a ton) over the load carried in 1901, and bearing in mind the fact that a considerable proportion of our roadside traffic consists of small consignments of native produce, such as plantains and vegetables, which cause a lot of light loading, this result may be considered very satisfactory.

Average Load of Passenger Carriages.—Again this year a decrease is recorded in the average number of passengers conveyed per vehicle, the number being 10·70 compared with 11·37 in 1901 and 12·32 in 1900, and this decrease is almost entirely due to the running of additional and longer trains on the Coast Line.

Overcrowding in certain trains by which the majority of the second and third class season ticket-holders travel to and from the offices in Colombo is very often due to passengers insisting upon crowding into particular trains. These trains are already made up to the fullest possible loads, but careful observation has shown that seating accommodation is generally available in trains immediately preceding and following the ones concerning which complaints of overcrowding are most frequently made.

As a matter of fact, the average loading of passenger carriages on the Coast Line is lower than that for the Railway taken as a whole, the average for 1902 being only 9·90 passengers per vehicle.

T. A. WYLIE,
Accountant and Assistant General Manager.

Colombo, May 14, 1903.

Table 1.—Abstract of Chief Statistical Figures relating to the Working of the Railway in 1902 compared with 1901.

* Loss.

† The repayment of the Rs. 400,000 raised on Debentures issued locally under Ordinance No. 2 of 1872 is included in these amounts, viz., 1875 Rs. 147,000; 1876, Rs. 153,000; and 1877, Rs. 100,000.

‡ Deficiency.

§ Amended as per Auditor-General's letter No. 105 of April 26, 1897.

‖ The total amount paid as interest was Rs. 1,493,082·25, but half the interest on the loan of £1,400,000 raised under Ordinance No. 14 of 1900, viz., Rs. 127,417·42, has been treated as part expense in connection with the raising of the loan (*vide* Auditor-General's letter No. 103 of May 13, 1903).

* The second line for 1887 has been worked on traffic train mileage only, to compare with 1888

REPORT OF THE ENGINEER OF WAYS AND WORKS DEPARTMENT FOR 1902.

THE length of open line has been increased during the year from 297 miles 11 chains in 1901 to 368 miles 57 chains by the opening of the Kelani Valley Line to Avisawella and the Northern Railway from Kankesanturai to Pallai.

The gross amount of working expenses of this Department (which includes maintenance of permanent way and works, all stations, and other Railway buildings) was for this year Rs. 945,657·38, as compared with Rs. 1,246,850·91 in the previous year, showing a decrease of Rs. 301,193·53.

The expenditure on the Sea Coast Line, the Main Line, and Nanu-oya shows a decrease of Rs. 121,651·06, Rs. 193,745·16, and Rs. 49,869·74, respectively, as against that in the previous year.

The expenditure on the Bandarawela Line, Matale Line, and Kurunegala Line shows an increase of Rs. 17,517·91, Rs. 19,084·93, and Rs. 3,517·85, respectively, as compared with that of the previous year. This increase is owing, chiefly, to the subsidence at 154 miles 40 chains on the Bandarawela Line and 13 miles 40 chains on the Matale Line, and to the washaway between Potuhera and Kurunegala during the year.

The expenditure on the Kelani Valley Railway Extension (from Maradana to Avisawella), the Northern Extension (from Kankesanturai to Chavakachcheri), and from Chavakachcheri to Pallai amounts to Rs. 12,207·44, Rs. 7,046·69, and Rs. 4,697·61, respectively, during the year.

The permanent way and works were maintained in efficient order during the year.

The renewals of steel rails and sleepers were :—

		1902.		1901.
Steel rails	Tons	883	...	2,623
Sleepers	No.	58,419	...	71,598

I annex lists of the obstructions which have taken place, rails broken, and new works carried out during the year.

NEW LINES.

The following sections of Railway which were under construction were opened for traffic on the under-mentioned dates :—

Section between Maradana Junction and Avisawella of 36 miles 66 chains on the 15th September, and from Kankesanturai to Pallai 34 miles 60 chains on the same date.

The maintenance of the Kelani Valley portion has from the date of opening been handed over to this Department.

The upkeep of the section between Kankesanturai and Pallai is still, however, being supervised by the Construction Department.

The opening of the Kelani Valley Railway on the narrow gauge (2 ft. 6 in.) marks a new epoch in the history of railway construction in the Colony, seeing it is the first break of gauge introduced since the opening of the broad gauge line to Kandy in 1867.

NEW WORKS.

The new works sanctioned for this year were all undertaken departmentally, with the exception of the interlocking of Veyangoda and Angulana stations, which was done on contract by Messrs. Walker, Sons & Co., Ltd.

Of the new works completed during the year, the most important was the new platform and over-bridge at Slave Island station.

This additional accommodation has considerably relieved the congestion of traffic on this portion of the Coast Line, but, in order to deal satisfactorily with the large increase in the suburban passenger traffic, the question of doubling the line to Mount Lavinia or Moratuwa will have to be faced at an early date.

SLIPS, &c.

For the first nine months of the year the line was comparatively free from landslips and washaways, but during the last three months, owing to the exceptionally heavy rainfall (practically the heaviest on record for the last thirty-two years), several serious washaways took place, notably at 13 miles 40 chains on the Matale Branch, where 80,000 cubic yards of embankment were washed away, and also at 154 miles 40 chains on the Haputale section, where a serious subsidence of over 20,000 cubic yards occurred.

The effects of this abnormal rainfall were also severely felt on the portion of line between Kadugannawa and Nawalapitiya, several of the culvert floors being scoured out and many portions of embankments being washed away.

I may here mention that during the interruptions caused to traffic through the above washaways every means were adopted to clear the line for the resumption of traffic as early as possible, and that, notwithstanding the trying nature of the work, owing to the discomfort of exposure to incessant rain, every one worked most willingly night and day.

In this connection I regret to have to record the death of Foreman Platelayer Carter from pneumonia contracted whilst working at the slip at 154 miles 40 chains.

A. PATON GRAY,
Engineer of Ways and Works.

REPORT OF THE LOCOMOTIVE ENGINEER FOR 1902.

I HAVE the honour to report that the whole of the rolling stock, plant, and machinery were kept in efficient working order during the year.

Owing to the increased mileage and the opening of the Northern Extension and the Kelani Valley Lines, the necessity for increased shop accommodation has become acute. This has been provided for to some extent in the Carriage Department, but not as yet in the Locomotive Department, and consequently the limit of output in the latter department has been nearly reached.

On representation to Government a sum has been provided in the Supply Bill for 1903 for alteration and extension of the machine shop, which is a step in the right direction, and will have a good effect in improving the efficiency and output of the department.

The engine mileage worked, including service, wayside, and yard shunting, was 1,947,529 miles and 20 chains, showing an increase of 113,835 miles and 60 chains.

The train mileage, including service mileage, shows an increase of 85,471 miles compared with 1901, the total being 1,441,492 miles and 20 chains.

The vehicle mileage has increased by 975,928 miles and 6 chains as compared with 1901, the total being 24,268,999 miles and 75 chains.

The fuel consumption shows a decrease of 1·74 lb. per engine mile and a decrease of 2·41 lb. per train mile, or a saving of about 1,512 tons.

	Rs.	c.
Contract price for coal, 1901	15	25
Do. do. 1902	14	75

The working expenditure for the year 1902 was Re. 1·047 per engine mile, showing a decrease of Re. 0·009, or a saving of 1 cent per mile, or Rs. 19,475, compared with 1901 :—

	Rs.	c.	Rs.	c.
Total expenditure	—		2,177,849	80
Less work done for other Departments	137,076	48		
Less surcharges	157	66		
			137,234	14
Total Working Expenses ...			2,040,615	66

Repairs to Engines.

1901.	Work done.	1902.
18 ...	Thorough repairs	32
10 ...	Light repairs	20
13 ...	Erected	6
16 ...	Painted	22

Two new engines and tenders for Main Line were erected and added to stock, and four engines for the Uda Pussellawa Line were also erected.

The following engines were fitted with the vacuum brake :—

1901.		1902.
5 ...	Engines and tenders	8
5 ...	Do. do. train pipes only ...	3
— ...	Do. with train pipe	1
— ...	Tender with complete vacuum brake ...	1

Work done on special authorities :—Sixteen covered goods wagons were erected and rivetted for Kelani Valley Line.

General Repairs to Carriages and Wagons.

1901.		1902.
121 ...	Bogie carriages	87
104 ...	Four-wheeled carriages	109
10 ...	Bogie covered goods	19
386 ...	Four-wheeled covered goods	361

Special Repairs.

1901.		1902.
61 ...	Bogie carriages were fitted with new roof canvas ...	54
2 ...	Bogie carriages were fitted with new steel underframes	5
55 ...	Four-wheeled carriages were fitted with new roof canvas	73
5 ...	Bogie covered goods were fitted with new roof canvas	16
59 ...	Four-wheeled covered goods	67
6 ...	Four-wheeled covered goods were fitted with galvanized covered iron roof	17
26 ...	Covered goods had the wheel base shortened to standard	7
5 ...	Engine cabs were fitted with new roof canvas ...	25

Coaching Stock fitted with Vacuum Brake.

1901.		1902.
— ...	Bogie carriages new stock	8
9 ...	Bogie carriages existing stock	2
5 ...	Four-wheeled carriages existing stock ...	4
36 ...	Train pipes fitted on to four-wheeled coaches ...	—

The following vehicles were rebuilt :—

1901.		1902.
3 ...	Four-wheeled covered goods	6
2 ...	Do. high-sided wagons	5
4 ...	Do. low-sided wagons	1
— ...	Do. ballast wagons	8
— ...	Do. gunpowder van	1
1 ...	Do. first class coach	1
2 ...	Do. iron high-sided wagons ...	—

Five bogie covered goods and five bogie low-side underframes were erected and lent to the Kelani Valley Line for ballast wagons.

One bogie covered goods underframe was erected and converted into a ballast wagon for the Uda Pussellawa Line.

The following vehicles were added to the Open Line Stock in 1902 :—

4 bogie thirds	5 cattle wagons
2 bogie brake and thirds	6 bogie iron low-sided wagons
2 bogie 1st, 2nd, and brakes	6 iron covered goods
40 covered goods	

Additional stock built for Northern Extension :—

2 heavy goods brakes	3 carriage trucks
4 horse-boxes	16 covered goods

Stock taken to pieces and re-erected at Jaffna for Northern Extension :—

14 four-wheeled third class	2 passenger brake vans
2 four-wheeled first class	20 covered goods
2 four-wheeled second class	

Stock under construction :—

4 bogie third class	1 bogie tri-composite
2 bogie brakes and thirds	1 bogie first and second
4 bogie second and thirds	20 sets of covered goods timber prepared

Stock erected for the Kelani Valley Line and put into traffic :—

5 bogie first and second composites	5 bogie high-sided wagons
10 bogie third class	1 bogie gunpowder van
5 bogie brake and thirds	1 bogie oil tank wagon
35 bogie covered goods wagons	1 crane
3 bogie low-sided wagons	1 crocodile wagon

The following painting and varnishing was done :—

1901.			1902.
16	...	Engines painted and varnished	22
159	...	Carriages painted and varnished ...	145
138	...	Wagons painted	218
271	...	Roofs of all classes painted	308
—	...	Underframes painted	20
—	...	Kelani Valley engines painted (special authority)	3
—	...	Bogie first, second, and brakes do. ...	2
—	...	Northern Extension carriages (Jaffna) do. ...	20
—	...	Do. horse-boxes do. ...	4
—	...	Do. carriage trucks do. ...	3
—	...	Kelani Valley carriages do. ...	20
—	...	Covered goods (open lines) do. ...	40
—	...	Northern Extension heavy goods brakes do. ...	4
—	...	Do. ballast wagons do. ...	6
—	...	Do. covered goods do. ...	16
—	...	Do. covered goods (Jaffna) do. ...	17
—	...	Kelani Valley goods stock do. ...	47

It will be seen from the above figures that the repairs in the carriage and wagon departments are about normal. The cause of the number of bogie carriages repaired being less this year than last is due to the condition of the stock, which has necessitated very heavy repairs in many cases, and a considerable excess of time and new materials.

The number of vehicles rebuilt and vehicles repainted shows a distinct improvement.

Steps should be taken at once to provide more accommodation for painting the stock. It is quite impossible to deal with it satisfactorily now, and consequently some of the engines have been put into traffic unpainted, whilst the carriage and wagon stock cannot be properly dealt with. A considerable amount of work is done in the open for want of cover; hence in wet weather it has to be abandoned, with the result that work gets spoiled, takes a longer time, and costs more than it should.

The Locomotive Department shows a great improvement in the output of work. In the year 1900 the total wages expended in the Locomotive and Carriage Department was Rs. 237,527.

The output in engine repairs for that year was—

10 thorough repairs	12 painted
7 light repairs	

In the year 1901 the total wages amounted to Rs. 254,451, or an excess of Rs. 16,845 over 1900, the output being—

18 thorough repairs	16 painted
10 light repairs	

Last year the total wages amounted to Rs. 237,988, or practically the same as 1900, but the output has been—

32 thorough repairs	22 painted
20 light repairs	

In other words, the carriage and wagon repairs being about normal, the output of engine repairs has increased some 200 per cent., and in addition over Rs. 100,000 worth of new materials has been worked into the engines for the same expenditure in wages as compared with 1900. This result speaks for itself.

Comparative Statement.

Engine Mileage.

Locomotive Engineer's Office,
Colombo, April 23, 1903.

H. G. UNSWORTH,
Locomotive Engineer.

Annexures.

No. 1.—List of Machinery in Workshops.

No. of Machine.	Description of Machine.	Condition.
	Machinery in Machine Shop.	
—	One double-cylindered horizontal steam engine, cylinder 12 in. diameter and 18 in. stroke, for driving machine shop	Good
—	Two old locomotive boilers for supplying steam to above	do.
1	Wheel lathe, chucks 5 ft. 6 in. diameter	do.
2	Do. 4 ft. 6 in. diameter	do.
3	Screw-cutting gap lathe, 11 in. centre, 16 ft. bed	do.
4	Screw-cutting lathe, 10 in. centre, 18 ft. bed	do.
5	Do. 7 in. centre, 12 ft. bed	do.
6	Hand lathe (sent to Kandy)	do.
7	Planing machine to take 16 ft. by 4 ft. by 3 ft.	Fair order; but no use for heavy work
8	Planing machine to take 8 ft. by 3 ft. by 3 ft.	Fair order; but no use for heavy work
9	Drilling machine	Good
10	Do.	do.
11	Shaping machine, 17 in. stroke, 7 ft. bed	do.
12	Given to Technical College	—
13	Screwing and tapping machine	Fair order for very light work
14	Slotting machine, 18 in. stroke	Old type
15	Shears and punching machine	Good
16	Screw-cutting lathe, 24 in. centre, 23 ft. bed	do.
17	Screw-cutting lathe, 6 in. centre, 8 ft. 9 in. bed	do.
18	Shaping machine, 14 in. stroke, 5 ft. 6. in. bed	do.
19	Screw-cutting lathe, 9 in. centre, 16 ft. 6 in. bed	do.
20	Wheel lathe, chucks 6 ft. 6 in. diameter	do.
21	Given to Technical College	—
22	Small bench drilling machine	do.
23	Screw-cutting lathe, 6 in. centre, 9 ft. 6 in. bed	do.
24	Screw-cutting gap lathe, 11½ in. centre, 15 ft. bed	do.
25	Hand lathe, 6 in. centre, 5 ft. 6 in. bed	Fair
26	Do. 6 in. centre, 5 ft. 6 in. bed	do.
27	Lapping lathe, 6 in. centre, 5 ft. 6 in. bed	Good
28	Facing and boring lathe, chucks 3 ft. 6 in. diameter	do.
29	Drilling machine	do.
30	Wheel lathe, chucks 4 ft. 6 in. diameter	do.
31	Facing and boring lathe, chucks 3 ft. 6 in. diameter	do.
32	Shaping machine, 18 in. stroke, 8 ft. bed	do.

No. of Machine.	Description of Machine.	Condition.
33	Radial arm drilling machine	Good
34	Shaping machine, 18 in. stroke, 8 ft. bed ...	do.
35	Screw-cutting lathe, 6½ in. centres, 9 ft. 9 in. bed ...	do.
36	Tyre drilling machine for wheels	do.
37	Wheel lathe, chucks 4 ft. 6 in.	do.
38	Screwing machine, ½ in. to 2 in. diameter ...	do.
39	Thorne's portable drill	do.
40	Screw-cutting gap lathe, 18 in. centre, 12 ft. bed ...	do.
41	Do. do. ...	do.
42	Double ended bolt lathe, 6 in. centre	do.
43	Do. do.	do.
44	Emery grinder for twist drills	do.
45	Facing and boring lathe, chuck 3 ft. 4 in. ...	do.
46	Drilling machine	do.
47	Do.	do.
48	Keyway and slot drilling machine	do.
49	Piston rod grinder	do.
50	Brass finisher's lathe, 8½ in. centre, 5 ft. 6 in. bed ...	do.
51	Do. do. ...	do.
52	Sensitive drilling machine	do.
53	Slotting machine, 12 in. stroke	do.
54	Slide bar grinder	Fair
55	Wheel lathe, chucks 6 ft.	Good
56	Do. 4 ft.	do.
57	Do. 4 ft.	do.
58	Screwing machine, ½ in. to 2 in. diameter ...	do.
59	Side planing machine, 40 in. stroke	do.
60	Tyre drilling machine for wheels	do.
61	Lathe (non screw-cutting), 15 in. centre, 20 ft. bed ...	do.
62	Shaping machine, 10 in. stroke, 4 ft. bed ...	do.
63	Do. do.	do.
64	Hollow mandrel lathe, 9 in. centre, 10 ft. bed ...	do.
65	Do. capstan lathe, 6 in. centre, 6 ft. bed ...	do.
66	Do. do. ...	do.
67	Sensitive drilling machine	do.
68	Do.	do.
69	Screw-cutting gap lathe, 12 in. centre, 12 ft. bed ...	do.
70	Do. do. ...	do.
71	Do. do. ...	do.
72	Do. do. ...	do.
73	Do. do. ...	do.
74	Universal lapping and grinding machine ...	do.
75	Drilling machine	do.
76	Do.	do.
77	Double ended bolt lathe, 7½ in. centre	do.
78	Do. do.	do.
79	Drilling machine	do.
80	Wheel lathe, chuck 4 ft. 6 in.	do.
81	Lathe for weigh-bar shafts	do.
82	Do.	do.
83	Wheel lathe, chuck 4 ft. 6 in.	do.
84	Do. do.	do.
85	Tyre boring lathe, chuck 6 ft.	do.
86	Tyre boring lathe, chuck 3 ft. 10 in.	do.
—	One double cylinder, horizontal, cylinder 10 in. by 18 in.	do.
—	One set plate rollers	do.
—	One hydraulic wheel press	do.
—	Three wooden troughs for grindstones	Fair
—	One emery grinding machine	Good
	Machinery in Blacksmiths' Shop.	
—	Portable engine for driving circular saw, cylinder 7¾ in. by 12 in.	Fair
—	Tangye's horizontal single cylinder engine, cylinder 12 in. by 18 in., for driving fan	Good
—	Two 10-cwt. steam hammers	do.
—	Two 5-cwt. steam hammers	do.
—	One old locomotive boiler for supplying steam to above	do.
—	Circular saw, 2 ft. 8 in. largest diameter of saw ...	do.
—	Tangye's patent noiseless fan	do.
	Machinery in Colombo Running Shed.	
—	Sheer legs	Good
—	Coal crane	do.
	Machinery in Kadugannawa Running Shed.	
—	Screw-cutting lathe	Good
—	Hand drilling machine	do.
—	Travelling crane and wagon	do.
—	Coal crane	Bad; should be renewed
	Machinery in Nawalapitiya Running Shed.	
—	Hand drilling machine	Good
—	Coal crane	do.
—	Hand lathe	Fair
—	Sheer legs	Good
	Machinery in Kandy Running Shed.	
—	Hand lathe	Good
—	Hand drilling machine	do.
—	Travelling crane and wagon	do.
—	Coal crane	do.

Locomotives (Broad Gauge.)		
Six-wheel coupled bogie engines		31
Six-wheel coupled engines		17
Four-wheel coupled six-feet wheel engines		19
Do. five-feet wheel engines		36
Do. tank engines		8
Shunting engines		3
Total		114
Coaching Four-wheeled Stock.		
Saloons		5
First class		11
First and second class composites		9
Second class		16
Third class		93
Prison van		1
Guards' vans		23
Horse-boxes, Main Line		2
Do. Nanu-oya Line		24
Carriage trucks, Main Line		3
Do. Nanu-oya Line		17
Fish trucks		12
Post Office vans		2
Total		218
Coaching Bogie Stock.		
Governor's saloon		1
State saloon		1
Inspection saloon		1
Refreshment cars		4
Do. Brake cars		3
First and second class composites (including four old sleeping saloons)		23
Tri-composites		3
Third class (including cooly carriages)		66
Brake thirds		35
First class		3
Second class		9
Sleeping		3
Brake tri-composites		2
First and second class and brakes		4
Total		158
Goods Stock, Four-wheeled.		
Covered goods wagons	Main Line, wood	615
	Nanu-oya Line, wood	
Do.	Iron	26
High-sided open wagons	Main Line	177
	Nanu-oya Line	
Do.	Iron	20
Low-sided open wagons (including 70 ballast wagons)	Main Line	83
	Nanu-oya Line	
Cattle trucks	Main Line	18
	Nanu-oya Line	
Gunpowder vans	Main Line	9
	Nanu-oya Line	
Lime and oil wagons	Main Line	26
	Nanu-oya Line	
Tea leaf truck		1
Timber trucks		8
Goods brake vans		32
Petroleum oil tank wagons		4
Total		1,019
Bogie Goods Stock.		
Covered goods wagons		21
Low-sided ,,		4
Do. ,, iron		18
Goods and brake van composites (including breakdown van)		7
Total		50
Service Stock.		
Travelling cranes		5
Crane wagons		3
Total		8
KELANI VALLEY SECTION—NARROW GAUGE.		
Locomotives.		
Four-wheel coupled three-feet tank engines		7
Coaching Bogie Stock.		
First and second class composites		5
Third class		10
Third class carriages and brakes		5
Iron high-side wagons		5
Iron low-side wagons		3
Iron covered goods wagons		35
Gunpowder van		1
Petroleum oil tank wagon		1
Crane wagon		1
Crocodile wagon		1
Total		67

REPORT OF THE TRAFFIC SUPERINTENDENT FOR 1902.

I HAVE the honour to submit my Administration Report for 1902.

The traffic for the year 1902 has been carried on without accident to life or limb. I regret, however, to have to record three occurrences in which trains were in collision, though fortunately without very serious consequences, viz.:—

(*a*) On the 12th May the 10.35 A.M. train from Kandy, after passing Ambepussa, ran into a ballast train which had stopped between Ambepussa and Mirigama to do some work. The Station Master of Ambepussa station was dismissed the service for having neglected the regulations laid down for the safe working of trains.

(*b*) On the 7th August the 5 P.M. train from Matara ran into some engines standing in the running shed road at Galle. The passengers sustained no injuries, and no serious damage was done. The pointsman was dismissed and shunter reduced.

(*c*) On the 13th September the 7.10 A.M. train from Kandy was let into the siding in which the 7.35 A.M. train from Colombo was standing at Ambepussa station. The engines and some wagons were damaged. The pointsman at fault was dismissed.

Length of Line.—The length of line open for traffic has been increased 71⅜ miles by the opening of a section of the Northern Extension from Kankesanturai to Pallai and a section of the Kelani Valley Line from Colombo to Avisawella.

Train Mileage.—The traffic train mileage was consequently increased 82,231 miles by these extensions and by extra train service on the open lines.

Traffic Receipts and Expenses.—The traffic receipts have appreciated 5 per cent. over 1901, but the traffic expenses have increased 5 per cent. also. This is principally due to the opening of the extensions, and to the fact that the Northern section has not yet become remunerative.

The details are as follows :—

	1901. Rs.	1902. Rs.	Increase. Rs.	Decrease. Rs.
General Superintendence ...	56,932	64,879	7,947	—
Traffic Charges ...	511,529	549,378	37,849	—
Running Staff ...	177,629	195,040	17,411	—
Telegraph ...	86,698	69,115	—	17,583
Total ...	832,788	878,412	63,207	17,583

Net increase, Rs. 45,624.

These items are dealt with separately below :—

(*a*) *General Superintendence.*—The increased expenditure under this head is due to the annual increments to the salaries of the Traffic Superintendent, Assistant Traffic Superintendent, and two District Traffic Superintendents ; salary and passage expenses of the new District Traffic Superintendent, Kelani Valley Line ; salaries of six new appointments on the open lines, viz., two relief station masters and four relief clerks ; batta expenses of relief station masters and relief clerks ; printing new train service books and time tables ; advertising special train arrangements, and passage expenses on account of the inspection and opening of the Kankesanturai to Pallai section of the Northern Extension.

(*b*) *Traffic Charges.*—The increase is due to the annual increments to salaries of the clerical staff and salaries of staff of the Northern and Kelani Valley Extensions, also printing appendix to the new train service.

(*c*) *Running Staff.*—Increase due to annual increments to salaries of guards of open line ; to salaries of new guards for the Northern and Kelani Valley Extensions ; also to the passage expenses of new guards from England.

(*d*) *Telegraph.*—The decreased expenditure under this head is due to the maintenance of the Railway telegraph and telephone services being made a charge on the Postal Telegraph Department.

Passenger Traffic.—There has been an increase of 77,721 ordinary passengers, but a decrease of 31,611 in cooly traffic, which reduces the excess over 1901 to 46,110 ; the coaching receipts have increased by Rs. 28,522.

Ninety per cent. of the increase in the passenger traffic was third class, but there is no particular cause to which the increase can be assigned.

Goods Traffic.—The goods traffic has increased by 19,394 tons, but there has been a falling off in live stock, also a large decrease in stone for the Harbour Works. The increased receipts on account of goods (including stone) amounted to Rs. 20,767, against which there was a loss on live stock of Rs. 7,740. The balance in favour of goods traffic being Rs. 13,027.

The tables below show details :—

Total ...	4,772,547	4,785,574	20,767	7,740	13,027

Nett increase, Rs. 41,549.

The increase in the goods traffic occurs in almost every class of traffic dealt with, the exceptions being Arrack, Salt, Other 3rd Class Goods, Timber 5th Class, Other 6th Class Goods, Railway Material, and Stone for Harbour Works.

There were large increases in Rice (3,207 tons), Copperah (2,864 tons), Timber 6th Class (1,55 tons), Tea packing (1,205 tons), Manure (6,851 tons), Plumbago (2,329 tons), and Petroleum (548 tons)

The following details of increases and decreases at various stations and the causes assigned fo them may be interesting :—

Kelaniya.—Increase of 3,193 tons, chiefly on account of manure for up-country.

Mirigama.—Increase of 1,333 tons. New cocoanut plantations having come into bearing copperah was largely manufactured ; also the general rise in importance of the district as a cocoanu planting district.

Rambukkana.—Increase of 427 tons. Increase in Railway material and 5th class goods.

Peradeniya New.—Increase of 544 tons. Increase on account of tea for Colombo and firewoo for Gampola.

Wattegama.—Increase of 340 tons, chiefly in tea and other estate products.

Ukuwela.—Increase of 253 tons. Some estates sending to Ukuwela station traffic previously sent to Matale.

Wharf.—Increase of 2,094 tons, chiefly in rice, tea packing, and bulk petroleum, also in manure for Kelaniya.

Galle.—Increase of 4,582 tons. Plumbago and rice were transported by rail in large quantities owing to the Municipal restrictions, early in 1902, of the load of a cart to one ton Plumbago market better than 1901. The depressed state of trade in 1901 was to a considerable exten removed in 1902, inasmuch as better prices were realized for plumbago, tea, coir yarn, &c.

Polgahawela.—Decrease 103 tons. Poor cocoanut crops.

Peradeniya Junction.—Decrease of 898 tons. Decrease in Railway materials.

Nawalapitiya.—Decrease of 169 tons. Decrease in Railway materials.

Katugastota.—Decrease of 187 tons. Decrease chiefly due to a large number of villagers having left the district for employment on the Northern Extension ; also due to a great dimunition of native traders in the district, and a vast exodus of Moorish traders to the Coast during the greater part of the year.

Talawakele.—Decrease of 451 tons. Decrease in tea.

Nanu-oya.—Decrease of 530 tons. Decrease in firewood traffic to Talawakele.

Moratuwa.—Decrease of 311 tons. Decrease in arrack, the rent having changed hands.

Paiyagala South.—Decrease of 160 tons. Decrease in arrack, of which there was a paucity owing to a general shortage of toddy. Some of the renters preferred transport by their own boats.

Beruwala.—Decrease of 276 tons. Decrease in arrack owing to contracts with Indian merchant having terminated.

It is satisfactory to note that the Coast Line goods traffic is improving, the total increase being 6,892 tons. All stations, excepting Moratuwa, Panadure, Paiyagala South, and Beruwala, contributed to this, the principal item being 4,580 tons at Galle, as shown above.

Northern Extension.—The goods traffic on the Northern Extension has not yet developed, only 2,367 tons having been conveyed during the nine months the line has been open. It is difficult for a district in which railways are entirely new to give up its old means of transport, but every facility is being given to freighters in the North, and there is a fair promise that the advantages of the Railway will soon be recognized and availed of.

Kelani Valley Line.—The traffic on the Kelani Valley Line during the three and a half months it has been open amounted to nearly 5,000 tons (4,879). This does not nearly approximate the estimate of 40,000 tons per annum quoted for it, but it is an earnest of the traffic that will offer, and there appears to be every reason to believe that when the line is completed to Yatiyantota the estimate will be fully realized.

It is early to judge of a Railway which is only fourteen weeks old and not open throughout, but I think there is evidence of a solid steady traffic which will fulfil our expectations, and I think so because there has been no rush—no flash in the pan as it were—but a regular, even, businesslike beginning, which bids fair to be well maintained.

Claims.—The amount paid in compensation compares favourably with the average for the past ten years, being only Rs. 1,860, while the average is Rs. 2,350.

Signalling and Interlocking.—The points and signals at the south end of the Fort station were interlocked with the simplex locking gear from the 14th June, and those at Kalutara North station with Pease & Co's interlocking from 20th February.

Improvements to Stations.—The Hatton goods shed was extended, and the clerical staff of the Goods Department provided with suitable office accommodation on an upper floor.

A new goods shed was built at Ukuwela station.

Hunupitiya station was provided with a store-room.

A station lavatory and urinal was built at Kollupitiya.

The Slave Island station was provided with a second covered platform and overhead bridge.

Waiting-rooms for gentlemen with lavatories were built at Gampola and Ulapane.

Special Trains.—During the year 2,258 special trains were run.

Missing Articles.—123 packages of missed luggage were restored to owners from the Found Property Office.

Notable Occurrences.—The abnormal rains during the latter part of the year under review caused considerable trouble at two particular points on the line where through traffic had to be suspended. I refer to the washaway of fifteen rail lengths of the line between Wattegama and Ukuwela stations on the Matale Branch on the 11th November, when traffic in through vehicles was interrupted for fourteen days; and the subsidence soon after between Haputale and Diyatalawa on the Bandarawela section, at the 154th mile on the 21st November, where also traffic in through vehicles was interrupted, and only resumed on the 1st January, 1903.

A. G. PERMAN,
Traffic Superintendent.

May 5, 1903.

PUBLIC INSTRUCTION.

FROM THE ACTING DIRECTOR OF PUBLIC INSTRUCTION.

THE following report by Mr. S. M. Burrows, Director of Public Instruction, deals with the history of the Department during the year till 10th November, when he was transferred to another appointment. I am responsible for the financial summary and the usual statistical tables, also for the section "Census and Education." In this section I have attempted to form an estimate of the work which remains to be done by the Department before it can be considered that adequate provision has been made for elementary education throughout Ceylon. It seemed premature to make any definite proposals for dealing with this, which is the main question now before the Department, till the Committee on the Educational Cess has made its report.

April 29, 1903.

J. HARWARD,
Acting Director of Public Instruction.

REPORT OF MR. S. M. BURROWS, DIRECTOR OF PUBLIC INSTRUCTION, FOR 1902.

I HAVE the honour to submit my report for 1902, which is arranged under the following heads :—

I.—Administration.
II.—Higher Education.
III.—Technical College.
IV.—The University Question for Ceylon.
V.—The Block Grant System.
VI.—Text Books.
VII.—Conference of Inspectors.
VIII.—The Board of Education.
IX.—Oriental Languages and Literature.
X.—Vidyodaya College.
XI.—Education and Crime.
XII.—English Teachers' Certificate Examination.
XIII.—The Training of Teachers.
XIV.—School Gardens.
XV.—School Treats and Prizes.
XVI.—Drawing.
XVII.—Industrial Schools.
XVIII.—Drill.
XIX.—The Coronation of King Edward VII.
XX.—Gansabhawa Schools.
XXI.—School Buildings, Government Schools.
XXII.—Report of Inspector of Schools, Northern Province.
XXIII.—Report of Inspector of Schools, Central Province.
XXIV.—Report of Superintendent, School Gardens.

I.—ADMINISTRATION.

I was in England on leave up to 30th March, during which time Mr. J. Harward acted as Director. On 10th November I was appointed Government Agent, North-Western Province, and Mr. Harward again administered the Department until the end of the year. I have therefore only had seven months of work in the Department during the current year, and have also left it. I can therefore give but a limited review of the work done, and can deal only with the past, not with the future.

The Inspecting Staff was the same as last year until September, when it was notably strengthened by the arrival of Mr. R. B. Strickland, appointed to the post of Inspector of English Schools. He was able to take some of the strain off Mr. Van Cuylenburg, who has been seriously overworked throughout the year, and his advent will cause a re-distribution of work next year. I was allowed to retain the services of Mr. H. Fernando (Master of the Royal College) as Inspector until the end of the year, and on 20th October he was transferred to the Northern Province to act for Mr. Leembruggen, who obtained three months' leave. From 1st January, 1903, he reverts to his fixed appointment in the Royal College, but leaves behind him a record of useful and conscientious work in both the Provinces that have been entrusted to him.

I may be permitted to say here how exceedingly grateful I am to the Inspectors for the loyal help they have always given me, and the ready way in which they have taken up and developed such new ideas as I have introduced. Their work is but little observed by the outside world, but its strict and tactful performance is nevertheless of great importance to the community.

In November arrived Mr. Evans, the Principal of the new Training College for English Teachers which is to be opened in January, 1903. Of the importance of his future work I have said enough in my two preceding reports to show that his arrival was a subject of warm congratulation.

II.—HIGHER EDUCATION.

(1) THE ROYAL COLLEGE.

By Mr. C. Hartley, Acting Principal.

Mr. C. Hartley, M.A., continued to act as Principal from the beginning of the year to August. Mr. Henry Fernando continued to act as Inspector of Schools during the whole year. To supply the vacancy caused by his absence, Mr. F. Van Cuylenburg was placed in charge of the First Form. In Mr. Harward's absence Mr. E. C. Spaar took the Fifth Form for the first term, and on his resignation Mr. C. LaBrooy took the Upper Third for the second term.

The following table shows the condition of the school for the last two years as regards numbers, attendance, and school fees :—

	1902.	1901.
Average number on register	317	313
Average attendance	289	283
Percentage of attendance	91	90
Candidates examined for admission	128	132
Number admitted	65	70
Number left	64	78
School fees	Rs. 20,135	Rs. 20,515

The special prizes for the year were awarded as follows :—

Turnour Prize	E. G. Mack.
Director's Prize for Classics	E. T. de Silva.
Shakespeare Prize	C. I. de Silva.
De Soysa Science Prize	C. I. de Silva.
Rajapakse Prize	E. F. de Saram.
Hewawitarana Prize	L. C. L. D'Zilva.

In the examination for the University Scholarship, awarded on an examination in English, Mathematics, and Science, the first, fourth, and eighth places were taken by E. G. Mack, L. C. L. D'Zilva, and B. F. de Silva respectively. The first has proceeded to London.

The following table shows the results gained by the Royal College in the Cambridge Examinations in 1901 and 1900 :—

Seniors.	1901.	1900.
Number of candidates	24	23
Number of certificates obtained	19	14
Number in Honours Division	6	4
Juniors.		
Number of candidates	45	53
Number of certificates obtained	33	32
Number in Honours Division	7	7

Form V. B and the four highest forms in the Lower Schools were again examined by the Cambridge Syndicate. The report is printed elsewhere,* and is on the whole satisfactory, especially in the case of the Lower School Mathematics ; weaknesses are noted in English subjects, especially in History.

The health and conduct of the school throughout the year have been satisfactory.

(2) THE UNIVERSITY SCHOLARSHIP.

This was again carried off by the Royal College, the winner being E. G. Mack. The report of the Examiners is as usual given in the Appendix.† It is unnecessary to repeat my remarks as to the nature of the competition, for reasons given in paragraph IV.

(3) CAMBRIDGE LOCAL EXAMINATIONS, 1902.

The number of candidates in 1902 was 564 ; in 1901; 508 ; in 1900, 429. Of the number for 1902 (564), 17 withdrew from the examination owing to illness and other causes. The number of junior boys who entered this year was 281, as compared with 268 in 1901; and the girls 87, as compared to 86 in 1901. Twenty-two senior girls entered in 1902, as compared to 21 in 1901 ; 174 senior boys entered in 1902 to 126 in 1901. The tables in Appendix‡ will give all further particulars.

(4) LONDON MATRICULATION EXAMINATION.

Ten candidates entered for the examination in January and three passed. For the June examination eleven entered their names and one passed. Four candidates were absent from the examination :—

January, 1902.

First Division.

J. Joseph	St. Patrick's College, Jaffna.

Second Division.

J. G. W. Gomis	Private study.
A. C. Mohammado	Richmond College, Galle, and private study.

June, 1902.

Second Division.

G. R. Siriwardene	Private study.

* See Appendix No. 2. † See Appendix No. 3. ‡ See Appendix No. 4.

DIAMOND JUBILEE PRIZE EXAMINATION.

Seven candidates entered for the examination. The prize was won by C. P. Samarasingha of St. Thomas's School, Matara.

III.—THE CEYLON TECHNICAL COLLEGE.

By Mr. Thomas Cockerill, Acting Superintendent.

The work of the year has been performed under extreme difficulties on account of the pulling down of temporary buildings to make room for the new College, the erection of another temporary building, and the conversion of rooms in the old building to other purposes. A considerable amount of time has been lost in this manner, and students must have suffered to some extent.

Several final examinations were held during the year. Eleven students passed the final examination in Civil Engineering; seven students passed in Surveying and Levelling; forty passed in Telegraphy and have been admitted into the Railway Department; one student has passed a special examination in Telegraphy, and has been admitted into the Postal Department; and fifteen students passed the Teachers' Drawing Examination, and are teaching drawing in schools.

The number of students on the roll in December, 1902, was 165, twenty-two less than in December, 1901 (187), which is accounted for by the students who had left the College and been drafted into the Railway Department and by students who had finished their course in Civil Engineering and left the College. In the Telegraphy Branch of the Electrical Department the teaching of Railway accounts was commenced in October, 1902, and from the report of the Accountant of the Ceylon Government Railway on the result of the final examination just held the results appear to be satisfactory. An entrance examination was held at the end of November to admit students into the Electrical Department. Ninety-five sat for the examination, but only forty-three passed the examination, and were nominated by His Excellency the Governor; only thirty-three of the above entered the College in February, thirty in the Telegraph Branch and three in the Electrical Engineering Branch.

During the year the steam boiler was found to be unsatisfactory, and sanction was given to fix a gas engine at a rental of Rs. 5 per month. This engine is now utilized to light up the buildings at night for the drawing class and any evening class which may be held.

It has been found better to arrange for the apprentice drawing class from 6 P.M. to 8 P.M. instead of 4 to 6, as previously arranged, as many of the students found it difficult to attend regularly. The result has been that the number of students has increased, and they are more regular in their attendance. We are of opinion that this class has a good future before it. The work of the Drawing Department has considerably increased, and more assistance is urgently required for this Department. Arrangements were made in February, 1903, for the teaching of Geometrical Drawing to meet the requirements of the Cambridge Local Examination. Thirty-two teachers from the colleges and schools in Colombo and district have been attending this class from 4 to 6 on Tuesday evenings.

A scheme was submitted to Government for the formation of evening classes near the close of 1902. The scheme was sanctioned, and a few of the classes commenced in February, 1903. Several of the classes are fairly successful, sufficiently so to encourage the continuation of them. We understand that many held back because of there being only half a term remaining, but are intending to join next term. We feel confident of the ultimate success of evening classes, but we cannot hope for much progress until the new buildings are at our disposal.

I have pleasure in acknowledging my indebtedness to the Instructors and Assistant Instructors of the College for their co-operation with me during the absence of the Superintendent on leave. The work has been exceptionally trying at times during the alterations and removal of fixtures, apparatus, and machinery, but it has all been done by the staff with the assistance of many of the students.

Sanction was received near the end of the year to make drill a compulsory subject. This regulation did not come into force until January, 1903.

The College has been lighted throughout with electricity, the work being done entirely by the students of the Electrical Engineering Department. It has of course only been done in a temporary manner with a view to all the fixtures being taken down again early in 1904. We consider, however, that the students have made a very creditable attempt to do their work in a workmanlike manner.

IV.—THE UNIVERSITY QUESTION FOR CEYLON.

A further stage has been reached in the development of this question. Early in the year we were informed by London University that their existing colonial centres would be continued; and thus it becomes possible for Ceylon youths who desire a degree, but cannot afford to go to Europe, to obtain an excellent degree locally. We in our turn are saved from the other two alternatives: a Ceylon University, which would have been eventually ridiculed, and affiliation with one of the Indian Universities. What the results of Lord Curzon's Commission may be as regards these seats of learning, it is difficult to say; but it was impossible to read the report of that Commission without rejoicing that we have so far battled successfully against a closer connection with them. But the whole question of higher education in Ceylon was by no means settled by this one decision. It bristles with difficulties (as, indeed, is the case in most countries, not excepting the Motherland), and it is a truism to say that it is a question which requires the best attention of the best brains in the Island. Connected with the general University question is the question of the University Scholarship, referred to on page B 3 of last year's report; the question of the Cambridge Locals, and their future relationship to the London course and the Scholarship; the question of finding a general test examination to take the place of the "plethora of examinations" which I deplored last year; and many others. It therefore seemed to me advisable to bring the whole matter before a qualified Committee consisting of the Board of Education with an added member or two, with the view of bringing out a report that could be laid before Government. The preliminary steps were taken in July: a series of questions was propounded and circulated among members, and a first meeting was held in October, at which several of these questions were partially discussed and the scheme of future operations more or less formulated. It was then proposed to invite expressions of opinion on the

various topics from teaching educationalists and residents; but at this stage I left the Department, and it will remain for my successor to state next year what conclusions have been arrived at. It is an inquiry that will necessarily take time, nor is there any instant cause for hurry. The state of our higher education is certainly open to criticism in many ways, but there is nothing desperate about it. On the whole, the education given in the upper forms of our best colleges is quite as good as can be expected under the circumstances; and the demand for something better, though intelligible and admirable, is of comparatively recent origin. In our process of development we must avoid the dictates of noisy impetuosity and rhetorical exaggeration, and guard above all things against flooding the country with "failed B.As." and graduates whose knowledge of the 'ologies is in inverse ratio to their knowledge of English.

V.—THE "BLOCK" GRANT SYSTEM.

There is less to be said on this subject this year than last, because it has now safely reached the experimental stage, while at the same time it is too early to tabulate results. The main points of the scheme were given in last year's report, and the preliminary visits were paid late in the current year. The scheme is now in the experienced hands of Mr. Strickland, the Inspector of English Schools, and the result of his examinations will be looked forward to with interest in the report for 1903. The experiment of exempting some of our best vernacular Government schools from examination trammels has also proved on the whole an encouraging success. They were examined towards the end of the year, after twenty-four months of freedom, with a view to testing the results of that freedom, and in all cases but one the results were decidedly satisfactory. The teachers deserve great credit in most cases for doing their best to act to what seemed to them the strange doctrines involved, but still more accrues to Mr. Van Cuylenburg and Mr. Fernando, by whose constant watchfulness and encouragement alone the experiment was made possible.

VI.—TEXT BOOKS.

The History of England in Sinhalese by Simon de Silva, Mudaliyar, promised in last year's report, was published during the year, as was Mr. Van Cuylenburg's "Notes of Lessons." The lectures delivered during 1901 and the early part of 1902 on educational subjects were also published in book form as a convenient handbook for teachers.

The usual list of books issued by the Department during the year will be found in the Appendix.

VII.—CONFERENCE OF INSPECTORS.

The annual conference of Inspectors was held in April, and was attended by all the Inspectors. Its sittings lasted two days, and a great deal of useful work was done in the way of Code revision. These proposed alterations and additions were, as usual, subsequently submitted to the Board of Education, and after full discussion there laid before Government. The final decision of Government had not been communicated before the year closed. It is not necessary to embody in this report the various technical points discussed, but the utility of—I may almost say the necessity for—this yearly meeting was amply demonstrated.

VIII.—THE BOARD OF EDUCATION.

The Board of Education met nine times during the year. Two of its meetings are necessarily taken up entirely with the English Teachers' Certificate Examination, and one of its meetings with the arrangements for the Scholarship Examination. It was also busily engaged in considering and amending the proposals for the new Code brought before it from the conference of Inspectors. But its most important work began towards the close of the year, when it resolved itself into an informal Commission to consider the whole question of higher education in Ceylon, with a view to laying a report before Government. The results of its inquiry will doubtless form the most interesting feature of next year's report. The task bristles with difficulties, nor is it likely that the result will meet with universal satisfaction, for education is unluckily the happy hunting ground of many other interests and objects besides the teaching of children; but at least it will be possible to show that every effort has been made to invite opinions and criticisms from all shades of thought and from all sources of local knowledge.

XI.—ORIENTAL LANGUAGES AND LITERATURE.

I was interested to find in the course of my travels that at many centres "piriwenas" had been started or had been for some time in existence, *i.e.*, classes of adults held by Buddhist priests for the study of Sanskrit, Pali, and higher Sinhalese. But it seemed that many of them were working without any very definite plan, and that only a little organization was required to turn this movement to good account, and, while zealously safeguarding its indigenous and independent character, to make it more progressive, attractive, and useful. I called a general meeting to consider the question. It was excellently attended both by the priesthood and the laity, and there seemed a unanimous desire to adopt the scheme I proposed, which was certainly not to turn these piriwenas into Government or subsidized high schools, but to start a course of yearly examinations, at first of an unambitious kind, gradually rising to higher flights, and possibly to a degree, if the movement was well responded to. A very representative general committee was accordingly appointed, and from it was selected a sub-committee to draft an examination schedule, which was duly passed, and the date of the first examination fixed for 1903. It now depends on the people themselves whether the scheme is a success. There will of course be many difficulties to contend with: possibly the enthusiasm that often attends a new idea may die off prematurely when it comes to real hard work. But it was at least refreshing to see the amount of real interest that is still felt in the ancient literature of this country, and it would be a literary sin not to make some effort to keep it alive.

Co-operation has also been solicited from and promised by the Tamils of the North, whose sangams are doing a work similar to the Sinhalese piriwenas, having Sanskrit for a common subject of study.

A sub-committee was formed to collect materials for a volume on Ceylon Literature and Archæology. There is an abundance of books and reports, but they want collating and bringing up to date.

X.—VIDYODAYA COLLEGE.

This institution, the first of its kind when it was started in 1870 for the revival of Oriental letters in Ceylon, and now with many efficient rivals, still continues to do its useful work. It is still managed by its able Principal, the High Priest H. Sumangala, one of the foremost Oriental scholars of Ceylon. The results of the examination this year show decided improvement in the work of the College over previous years. The examiners in all departments of the College work have sent in very satisfactory reports, and I consider it a healthy sign that many priests have taken up the examination in Arithmetic and done well in that subject, gaining in some cases the maximum of marks. I hope to see the Principal of the College giving still more encouragement to the acquisition of this branch of knowledge by the priesthood, who, though a very intelligent body of men in other respects, are deplorably out of touch with that best training-ground for the intellect, Mathematics.

The College continues to receive the block grant of Rs. 1,000 a year after examination, originally given by Government to encourage the only centre in the Island for the study of Oriental literature.

XI.—EDUCATION AND CRIME.

If education is really doing one very important part of its work, improving the morals of the people, there ought surely to be some sign of it in the criminal records of the country. Possibly in the case of certain classes of crime, such as forgery, education has to a certain extent no deterrent effect, but rather the opposite; but as regards what may be called the grosser kinds of crime, there ought by this time to be some results to show. Let it be at once admitted that such "results" as embodied in statistics must be received with the greatest caution. To analyze the actual motive causes of any particular crime is a most delicate and difficult task, and such figures as I proceed to give must also be taken for what they are worth.

I received permission from the Inspector-General of Prisons to investigate the matter for a year at Welikada Jail, our largest criminal depôt. The result was this. Crimes and offences under 66 heads came under notice, from murder to the most trivial charges. The number of offenders dealt with was 1,757. Of these, 1,090 were illiterate. Of the balance, 617 had only passed the very lowest standards in our schools (Standards I. to V.), while only 50 had anything like a real education, *i.e.*, had passed the middle standards (VI. to VIII.). As I understand that return is to appear in the Inspector-General of Prisons' report, I do not give it in mine. Whether the investigation is worth continuing must of course depend on the decision of Government.

XII.—ENGLISH TEACHERS' CERTIFICATE EXAMINATION.

There were a few slight gleams of hope as regards this examination. The number of candidates and the number of passes were larger than usual, and nearly all the examiners testify to some slight improvement in the work. Their reports are printed as an Appendix,* as it is believed that the publication of these reports on the last two occasions has done some good, and has helped both teachers and managers to see where some of the weak points are to be found. That the work done is still as a rule disgracefully bad can only be sorrowfully admitted, but it is satisfactory that the first signs of improvement should be coincident with the starting of the new Training College for English teachers. On that of course and on the expert efforts of Mr. Evans our best hopes are centred. We have hitherto been expecting bricks without straw by examining without training.

XIII.—THE TRAINING OF TEACHERS.

That this subject need occupy but a few brief lines in the present report is a subject for warm congratulation, for this arises from the fact that the long-wished-for Training College for teachers is an accomplished fact. The new Principal, Mr. Evans, with very high credentials from England, arrived in November, and was occupied during the last two months of the year in gaining such practical experience of the existing state of affairs as the time permitted. The College will actually begin operations early in January. To guess beforehand what Mr. Evans' recommendations will be, what opinions he has formed, what hope he can hold out, would entirely be out of place here and now. It may suffice us to know that a new era has dawned, and that, whatever long penance we may have to do for the sins of the past, it will lead to our educational regeneration.

XIV.—SCHOOL GARDENS.

The full and interesting report supplied by the Superintendent of School Gardens (see chapter XXIV.) may well take the place of any lengthy remarks from me. The school garden scheme has done good work during the past year, enough at least to show that if it is given time and encouragement from all quarters it may have a very considerable future. It must take time because a combination of favourable circumstances is necessary for a really successful garden, and the possibility of these has to be carefully studied on the spot, and the mere travelling involved in classifying the various schools according to their possibilities and arranging a suitable programme for those worth consideration is a lengthy process. But I continue to claim for the scheme that (1) it is a first step towards making the village schools something very different from what it has been in the past, viz., a centre for practical, useful knowledge, as well as for mere book-learning, and I hope the garden scheme may shortly be supplemented by a simple industrial scheme and a sanitary knowledge scheme suited for village requirements; (2) we should be falling far behind other countries if some effort of the kind were not made.

XV.—SCHOOL TREATS AND PRIZES.

Last year I chronicled the successful treat to Government school children organized for the first time at Matara by Mr. Hill. This year the North-Central Province has taken up the torch, under far greater difficulties, owing to the distance the schools lie apart and the character of the country. But no less than 364 children were collected at Rambewa, thanks to the energy and kind heartedness of Mr. Booth, Government Agent, and his Assistant Mr. Plant; and the account of the gathering by the latter gentleman, which appears in the Appendix,† will, I am sure, be read with interest.

---

* See Appendix No. 5.

† See Appendix No. 7, 1 and 2.

Mr. Murray, when Government Agent, North-Western Province, started an excellent idea, that each Gansabhawa should vote a small sum for prizes to the Government schools within its limits. It has worked admirably, and is indeed a realization of the suggestion I made last year, though quite independent of it. The prizes at each school are given away by the Ratemahatmaya or the President, if the Government Agent cannot be present, and the knowledge that these prizes are practically paid for, not by Government or by the Department, but by the people themselves, adds to their importance. A universal adoption of this idea would have the best possible effect.

A wealthy Moorman, Mr. Magdon Ismail of Galle, set a bright example to his countrymen by giving a considerable sum of money (nearly Rs. 300) to be distributed among the Moorish girls' schools of the Southern Province in prizes for attendance and needlework. I give a special place in the Appendix to the Inspector's account of the function because of the distressingly backward state of education among the Moors—a state that will never improve until their leading men follow Mr. Ismail's example and take a keen personal interest in the matter.

XVI.—DRAWING.

It is satisfactory to be able to note that the introduction of drawing, in which His Excellency took so warm an interest, has passed the experimental stage and become assured of permanent and increasing success before the termination of his Governorship. I venture to think it one of the most important steps forward that has been made for many years. I am convinced that there is considerable local talent, if only it is given a chance; and I have watched with interest during the year in various classes and examinations the gradual development of one of its most important consequences —a tendency to resort to illustration on the blackboard instead of mere oral declamation. I annex here Mr. Bartlam's report:—

Ceylon Technical College Drawing Department.

SIR,—I HAVE the honour to state in reply to your inquiries on the above subject the following particulars.

The principal classes were those for the training of teachers of Drawing in Elementary and Secondary Schools. At the commencement of 1902 there were 28 attending these classes, which number increased to 36 at the end of the year. In addition, ten Normal School students attended twice a week. The classes for apprentices and others seem now to be well established, the numbers having increased from 8 to 16; at this class Practical Geometry, Perspective, Architectural, and General Drawing is taught, and there is now a very good set of students attending. At the classes for boys and girls there were sixteen students, and four at the ladies' painting class, making a total of 82 students, exclusive of those attending other departments of the College who received instruction in Drawing and kindred subjects.

The first examination for the Teachers' Drawing Certificate was held in September. Thirty students presented themselves for examination. The course of instruction covers a period of two years. As the result of the first year's instruction three candidates were successful in obtaining the First Grade Certificate and twelve the Second Grade.

I am, &c.,
A. BARTLAM.

XVII.—INDUSTRIAL SCHOOLS.

I gave my own opinion on these schools with some freedom in last year's report, but the matter seemed to me important enough to form the subject of a careful inquiry. I determined to divide the subject into two parts, and during this year to take up needlework and industrial work for girls, reserving Boys' Industrial Schools for 1903. I was most fortunate in securing the help of a representative and expert committee of ladies. Without their aid, indeed, the scheme could not have been attempted, for he is a bold man who asserts any real knowledge of the higher flights of needlework. The committee met some seven times, and I would ask leave here to express my warm gratitude to its members for the time they spared from a busy life and for the invaluable help they gave me. Advice was also sought from, and freely given by, those in charge of large girls' schools in all parts of the Island; and by the end of the year it was found possible to formulate a draft report, which will be laid before Government early in 1903. It would be unseemly to disclose the tenour of that report until the decision of Government is known, except to say that the real difficulty in these matters is not so much to see what ought to be done as to appraise the financial effects of contemplated changes—a consideration of the first importance where funds are limited.

XVIII.—DRILL.

Steady progress is, I think, being made in the matter of drill, and no apology is needed for devoting a special paragraph to this subject, for in this country, as in all others, the physical development of the children is a matter of the first importance. Drill is compulsory in all Government schools, and a great deal more attention than formerly is paid to it at the annual examinations and visits without notice. I have no hesitation in saying that good results are already visible as regards briskness, prompt obedience, and upright bearing. Increasing efforts are being made to get over the main difficulty—the inexperience of many of our rural teachers—by sending them for brief periods to the nearest school where the drill is good, or, if they are too old to learn and demonstrate, by sending the most promising of their assistants or monitors. Outdoor games, too, are steadily encouraged; and rounders and cricket, played with locally-made implements, are now common at most large schools and pleasant to watch. This has led to an increasing demand for playgrounds, and much gratitude is due to the revenue officers, who have done their best to provide these wherever possible. Native games, too, especially "likeliya," are often played on the school premises. In Aided Schools, too, distinct if slow progress is being made in this direction.

The Cadet Battalion has a most satisfactory year to look back to. Six of our largest schools now supply a company apiece, 3 in Colombo, 2 in Kandy, and 1 in Galle; and the numbers could be easily increased were they not wisely limited for the present to 400. The Battalion paraded with other troops for the first time at the celebration of the King's Coronation, and the General Officer Commanding, in his remarks upon the parade, was good enough to say that "for a first appearance on

parade it did remarkably well, and I have no hesitation in offering my congratulations on its turn-out generally, and the creditable manner in which it acquitted itself generally on this historic occasion." Route marches and church parades have also helped to bring the companies together, and to initiate and instil that invaluable characteristic of such a Battalion *esprit de corps*. But the success of the scheme has depended and always must depend mainly on the encouragement given to it by the principals of the schools, and the keen and ready help afforded by those masters and boys who have accepted honorary commissions. It is hoped that a Band will be started next year, and that the Battalion will be represented at the annual Camp of Exercise.

XIX.—THE CORONATION OF KING EDWARD VII.

It was a difficult matter to know how best to impress the great historical fact of the Coronation upon the children of the 500 Government Vernacular Schools (for of course in the case of Aided Schools it was left to the Managers to decide what steps they would adopt). Medals were suggested, but abandoned, as a native child wearing nothing above the waist cannot easily wear a medal and can easily lose it. At last it was decided to present every school, large and small, with a coloured picture of the King in his Coronation robes, framed in teak and glazed. A copy of the Coronation Proclamation in the vernacular and of a Coronation ode written by Sri Dharmarama were sent with the pictures, and at nearly every school the hanging of the picture was made the occasion of a little function, followed by sports for the children and fireworks. The idea seems to have given general satisfaction and to have had its effect. The cost of the pictures (Rs. 2,400) was defrayed by Government.

XX.—GANSABHAWA SCHOOLS.

In order to make continuous the account of the remarkable experiment in Tamankaduwa (see paragraph XXVII. of last year's report), I annex a further report on these schools from the Revenue Officer, Mr. Jayawardene, to whom their success has been mainly due :—

Gansabhawa Schools in Tamankaduwa.

A beginning to establish Gansabhawa schools was made on the 15th July, 1899, by starting one at Mutugalla, a village in Egoda pattu, and this was followed in quick succession by the establishment of other schools in all the three subdivisions of Tamankaduwa district, and the total number of schools at present is 20. I have reported at great length by my report No. 100 of 15th March last as to their establishment and working, and I have not to add much in this report. There are six schools in Egoda pattu, nine in Meda pattu, and five in Sinhala pattu. Out of these, Tamil is taught in fourteen schools, Sinhalese in five, and Tamil and Sinhalese in one. The total number of scholars is 712, including girls. In some of the schools the Fourth Standard has been reached. The teachers are paid at the rate of 25 cents per head per mensem of the children educated, except the teacher of Topawewa, who is given a monthly pay of Rs. 25, as he has to do a deal of travelling as Inspector of other schools, and this expenditure is met out of Gansabhawa Funds and the Government grant of Rs. 1,000. School buildings have been put up by the villagers in all the villages in which there are schools. A portion of the Government grant has been spent in procuring a desk and a bench for each of the schools, as the children experienced difficulty in sitting on the ground and writing their copy books. One of the schoolmasters, P. M. Omaru Lebbe of Hathamune, resigned on the ground of insufficient pay in July last, and A. Tanga Udaiyar was appointed in his place. Four new schools that were in contemplation of being established could not have been opened for want of teachers.

All other necessary information I have given in my report No. 380 of this day's date.

G. JAYAWARDENE,
December 31, 1902. Revenue Officer.

XXI.—SCHOOL BUILDINGS—GOVERNMENT SCHOOLS.

In 1901 24 new buildings were provided, 23 enlarged, and 86 underwent repairs. In 1902 60 new buildings were provided, 28 enlarged, and 74 underwent repairs.

Of the 60 new buildings put up in 1902 in the various Provinces, special mention must be made of the Bomiriya Boys' School building, in the Hewagam korale of the Western Province, put up by Don Hendrick and Don Cornelis. It is a commodious, substantial, and attractive tiled bungalow, the sort of building most suitable for school purposes. The owners have expressed their willingness to transfer sufficient land and the building to Government. The Wewala Boys' School and the Diyagama Girls' School in the Salpiti korale put up by the Government Agent, Western Province, deserve mention. Mr. S. T. Gunawardena, Mudaliyar of the Pasdun korale west, has put up a large, substantial, and tiled bungalow for the Halwala school. The Director is informed by the Assistant Government Agent, Kalutara, that there now exist similar buildings for all the nine Government schools in this korale, of which eight have been built since this Mudaliyar came to the korale.

It is gratifying to find that the old cattle-shed type of building is now superseded in many cases by permanent structures. The sooner the people realize that a substantial building once put up, whatever its cost may be, will be much cheaper to them in the long run, the better, because they will be relieved of the yearly repairs which thatched buildings render necessary.

The attendance in Government schools is steadily increasing since the introduction of the rules referred to in the Director of Public Instruction's Circular of November, 1900, in spite of the fact that some headmen are very reluctant to prosecute defaulters at the Gansabhawa, and that, even when prosecuted, some Presidents let off the defaulters without imposing any fine on them. In consequence of this marked increase in the attendance, the teachers are urging on the Director the necessity for increased accommodation.

It is now the policy of the Department not to accept any new school building unless it is on a plan approved by the Department, because it was found that in many school buildings no suitable quarters were provided for the teachers to live on the premises. It is absolutely necessary that the teachers should live on the premises, without which they can bestow no proper care on the school

gardens attached to the schools, apart from the question of insuring the safety of the school belongings. To compel the teachers to live on the premises without providing a room for them, a storeroom for the belongings, and a kitchen to cook their meals in is really a hardship on them. In some cases the teacher is quite new to the place, and has neither influence nor the necessary means to provide these appurtenances himself.

The owners of a few school buildings put up on private land having objected to any enlargement of the buildings, it was decided not to put up in future any building on private land unless the land is formally transferred to Government or the owners agree to lease the land for a long term of years.

S. M. BURROWS.

XXII.—REPORT OF MR. R. H. LEEMBRUGGEN, INSPECTOR OF SCHOOLS, NORTHERN PROVINCE.

I have the honour to submit my general report for the year ended 31st December, 1902.

School Supply.—The number of registered Grant-in-Aid Schools at the beginning of the year was 388 in the Northern and 139 in the Eastern Province. These schools are classified below :—

Table I.

	Northern Province.							Eastern Province.					
	Church of England.	Roman Catholic.	Wesleyan Mission.	American Mission.	Independent Catholic.	Private Management.	Total.	Church of England.	Roman Catholic.	Wesleyan Mission.	Private Management.	Total.	Grand Total.

Vernacular Schools	60	80	41	122	4	37	344	7	23	92	4	126	470
Total ...	67	88	50	133	4	46	388	8	26	100	5	139	527

In my last report I showed that while in certain parts of the peninsula of Jaffna fairly adequate provision was made to supply the educational wants of the people, in other parts of the Northern and Eastern Provinces this provision was extremely meagre, I have very little progress to record in the direction of opening schools in backward districts. Unhappily the tendency on the part of Managers, who make applications for registration of new schools, appears to be to locate these schools in districts already pioneered and successfully worked. With regard to such districts the question arises where the school supply is to stop. In a circular recently issued Inspectors are requested, in reporting upon applications for registration, to deal with the question whether schools, on behalf of which the applications are made, are really required to meet the educational wants of the neighbourhood. In writing upon this subject in 1896 I said : "The decision of the question whether in apparently school-crowded localities the Educational Department ought or ought not to encourage the opening of new schools is not so absolutely easy as may be supposed. Cases often occur where parties on one side vehemently declare that conditions of population, &c., would not justify the opening of new schools, while parties on the other side produce figures, sufficiently verified, to prove the necessity for more schools. There have been instances in which Managers were led to believe that the opening of a new school would sensibly lessen the attendance at an old-established school ; but where the latter has been well situated with a fair population in the neighbourhood, these fears have not been realized. The explanation of the phenomenon that a good attendance at a new school does not materially diminish the attendance at an old one, not far removed, is that increased exertions are made to bring children to school : the neighbourhood had not, so to speak, been properly developed, and Managers had not realized the large number of children who were not under instruction.

Number on List and Average Attendance.—The total number of pupils on the list of the Grant-in-Aid Schools which were examined in 1902, exclusive of those in the Training Schools, was 35,987, and the aggregate average attendance 23,143, or 64 per cent. of the number on list. The proportion of the average attendance to the number in the rolls was, as it has been for some years back, the highest, for the Northern Province, in Group XV. of the District Classification, viz., Batticotta, with a percentage of 70 ; and the lowest in the Kalmunai group of the Eastern Province, with a percentage of 54. Taking the attendance as a whole, the progress made cannot be regarded otherwise than as satisfactory. There are twenty-three groups of schools in the Northern and Eastern Provinces, in which the average attendance for the year ranged from 60 to 70 per cent.

Schools examined.—The number of Grant-in-Aid Schools examined during the year, not including the Training Schools, was 504, viz. :—

	Northern Province.	Eastern Province.
English Schools	27	8
Anglo-Vernacular	6	3
Vernacular	339	121

The table below gives the results of this examination in the three R's and in class subjects :—

„ VIII.	35	67	97	97	76	—	—	—	90	86

Nine schools in the Northern and four in the Eastern Provinces were, for obvious reasons, not presented for examination. Some of these schools have been subsequently closed. One English and eleven Vernacular Schools in the Northern and one English and two Vernacular Schools in the Eastern Province were examined for the first time in the year, these schools having been placed on the list of Grant-in-Aid Schools during 1901.

Proficiency in Standard Subjects, English Schools.

Reading.—It will be seen from Table II. that the average standard of reading is fairly high. The general character of the reading varies, however, greatly in different schools, and depends largely upon the efforts of the teachers. The lowest percentage of passes obtained in the subject in any school was 67, and the highest 94. Reading is a difficult subject to teach and a difficult subject to examine in, particularly in village schools. There are more weak passes in Reading, I believe, than in either Writing or Arithmetic. The overuse of verbal memory and the dictionary and the offering of one lingual coin for another, both equally unknown to the pupil, still continue, but less so than formerly. There can be no objection, educationally, to the use of synonyms in themselves, provided the meaning is understood by the child. Perhaps to a Tamil youth it is a real gain as extending his vocabulary. I have often noticed that the duty of attending to the reading of a class is entrusted to a teacher least qualified to teach it properly. In reality the reading lesson should be regarded as the most important of all lessons, and one which demands the careful attention of an intelligent teacher.

In one or two schools that I can call to mind the teachers are evidently so impressed with the importance of getting children to speak out that their lower classes are taught to shout out their reading lessons. I can hardly recommend this as desirable in all cases, but some schools, especially girls' schools, might certainly adopt it as a great improvement on the present manner of reading and answering to questions put.

Writing.—The average percentage of passes in writing is slightly lower than that obtained in previous years, owing to the fact that the amendments of the Code for 1901 came into general operation, and the passages selected for writing from dictation were from reading books not used in the schools. The fears entertained by great many teachers that the amendment of the Code referred to would be productive of disastrous results at the annual examinations have, I am glad to find, not been realized. Out of 35 English Schools in my district, 22 obtained over 75 per cent. of passes, and in only two of them did the percentage fall below 50. To a certain extent the failures may be traced to defective instruction in the lower standards and to a careless and defective pronunciation on the part of teachers. Judging from the way, too, in which teachers dictate, when they are asked to do so on occasional visits of the Inspector, it is to be feared that many of the advantages to be derived from a dictation lesson are missed. The cultivation of strict attention, promptitude, and honesty is to a great extent sacrificed when the lesson is taken so leisurely that most of the children have time to look about them. Hence the result of the test applied on the day of examination is often quite a revelation to an easy-going teacher. Handwriting has greatly improved of late, owing to the improvement in copy books, but there are a great many schools in which it is very poor. With the exception of two or three schools, I may say that there is nothing like a definite character in the handwriting. The use of several varieties of copy books in the same school should be discouraged.

Arithmetic.—In Arithmetic the improvement is greater than it appears from the average percentages given in Table II. In nine English Schools the percentage obtained in this subject was over 75 and in three other schools over 70. In no subject more than in Arithmetic does right or wrong teaching in the lower standards affect a child's whole school life. It is quite a common thing to see pupils, even in standards higher than the second, reckoning on their fingers or by strokes on their slates. The reason is not far to seek. Instead of having been trained while infants to deal with numbers in groups and thus made perfectly at home with their properties and their relations, they have been allowed to count by units, and have been forced to deal with abstract before being made familiar with concrete numbers.

Geography.—Progress in this subject is still backward, but the low average percentage earned in it is due in a great measure to the very unsatisfactory examination results of some schools in which the percentage falls below 33. I note, however, that in seventeen schools the percentage was over 50, while in four of these seventeen the percentage rose to over 75.

Grammar.—Grammar in English Schools secures a larger percentage than Geography, because of the accuracy with which the easy exercises of the Third Standard are performed. I observe, however, less rote work, a truer appreciation of the educational value of the subject, and in consequence more intelligent methods of teaching it. Independently of its use as a means of acquiring a knowledge of language, Grammar, if the proper methods of instruction are intelligently followed, does, even with children, act as a species of logic enabling the mind to trace the relation of cause and effect.

Composition.—Composition in the highest standards of English Schools shows some improvement. The point of a story is better grasped in Standard VII., and in Standard VIII. the subject-matter is less meagre and the pupils give evidence of more general information. But here, again, the need for careful supervision and collective instruction is apparent. I would in this connection suggest the propriety of introducing Composition all through the standards, save perhaps the first. Composition classes would be quite within the capacity of children, and would be specially beneficial to native youths, giving them the power of using the English language with practical correctness. In English Schools on a vernacular basis I find that translation from the vernacular into English in all the standards from the third has proved very useful.

History.—The examination results in this subject have, as a rule, been fairly satisfactory.

Specific Subjects.—The table below gives the specific subjects in which pupils of different schools were presented for examination, the number of schools which took up this subject, and the average percentage of passes gained in each :—

Table III.

Subject.	Number of Schools which took up the Subject.	Percentage of Passes earned.
Algebra	23	52
Geometry	21	46
Latin	8	35
French	3	63
English Literature	5	68
Chemistry	3	79
Light and Heat	2	66
Electricity and Magnetism	2	66
Physiology	10	84
Laws of Health	8	71
Domestic Economy	5	81
Bookkeeping	3	58
Mensuration	2	23

It is very seldom that, after examining a school in which specific subjects have been taken up, I can feel that the time would not have been better spent in the teaching of English as a language and in making the elementary and class subjects more sound and thorough. To the majority of Tamil boys and girls English is practically a foreign language. Their vocabulary of it is limited, limited perhaps to what they learn or hear at school. It is often difficult to get them to put the gist of a passage which they have read in their own words, and still more difficult to get them to reproduce the

substance of a story read out to them in fairly decent and readable English. The structure of the English language, particularly in its orthography and syntax, is so widely different from that of the Tamil, that the successful study of the one, it may be said, means very much the equally successful unlearning of the other. Before pupils have time to make themselves conversant with the difficulties of one foreign language they are often forced to deal with the difficulties of another, and perhaps to do a smattering of Mathematics and Science in addition. No wonder that in their endeavour to assimilate all this information they neglect, or do indifferently, what in fact is to the majority of them the most important and the most useful part of their education, viz., a thorough knowledge of English.

Vernacular Schools.—The examination results in Reading and Writing in Vernacular Schools call for no special remarks, save that the dictation exercises from reading books not used in the classes seem to have produced no sensible diminution in the percentage of passes obtained in Writing.

In Arithmetic there appears to be some slight improvement. I observe that in 130 Vernacular Schools the percentage in this subject fell below 50. The number of children who fail is still considerable, but the number of those who know nothing or next to nothing of their work has very much diminished, and the number able to pass well has increased. I have in almost all cases marked the papers of the middle standards in this subject, and I have also adjudged the slate work of the primary standards in a large number of schools. I have been struck with the fact that a large number of children fail in working mechanical sums. Why should it be so? Not from ignorance of method, but from inaccurate working, which arises from two causes: (1) the pupils are neither ready with nor sure of their tables; (2) they do not have sufficient practice in mental calculation. Rapid and correct calculation can only be obtained by practice. As the best means to secure this, Mental Arithmetic should, as I have pointed out in previous reports, be more extensively practised. There is no better exercise for all standards, with a view to accuracy, than the casting up of long additions at sight. The bad habit of counting on fingers and by strokes on slates, before referred to, as a substitute for calculation, are far too prevalent, and should be strictly prohibited.

Geography.—The examination results of this subject in the middle standards, the paper work of which has been marked by me, have been generally satisfactory. It will be seen from Table II. that the percentage obtained in it in the Practising and Girls' Vernacular Boarding Schools is higher than the average percentage in English Schools. The progress in the Primary Schools is disappointing. I note that there are 201 Vernacular Schools in which the subject has not been taken up, or in which, if it has been taken up, not a single pass has been obtained.

The results in Grammar and History have been more satisfactory.

Pupil Teachers.—It is evident that more attention is being given to the training of pupil teachers than formerly, for during the year under review 51 pupil teachers were presented for examination in schools of all classes, and 40 of these, or 78 per cent., passed.

Discipline.—A good test of discipline is found in the way in which the pupils of a school receive instructions from the Inspector to do something that they are not accustomed, perhaps, to do every day. Cards marked A, B, C, D, &c., are issued on the day of examination, and each pupil is asked to put down in the right-hand top corner of his or her paper the letter found in his or her card. The teacher is often asked to explain to the pupils who are working what is to be done. This may seem a ridiculously simple thing to dwell upon, but it is annoying to find when the papers are collected that the distinguishing letter has been put down where fancy dictated or has been omitted altogether. It is still more annoying to see teachers attempting, till checked, to rush from one pupil to another, whispering "Put down A here, put down B there," &c.

I may also state that under this head nothing furnishes a better test of the tone of a school than the amount of honesty shown during examination in the midst of numerous impulses to its violation.

XXIII.—REPORT OF MR. E. A. SENEVIRATNA, INSPECTOR OF SCHOOLS, CENTRAL PROVINCE.

I have the honour to submit my general report for the year 1902.

The Central District, comprising the Central, North-Central, North-Western, and Uva Provinces, has now been in my charge for a little more than a year.

The annexed tabular statement gives particulars of the distribution of the schools over the four Provinces and of the scholars in attendance :—

	Number of Schools.	Number on Roll.	Average Attendance.	Percentage of Average Attendance.
Central Province.				
Government Schools ...	67	8,066	5,001	62·0
Grant-in-Aid Schools ...	123	9,742	6,028	61·8
North-Western Province.				
Government Schools ...	37	4,348	2,597	59·2
Grant-in-Aid Schools ...	74	7,082	4,341	61·2
North-Central Province.				
Government Schools ...	16	1,648	1,006	61·0
Grant-in-Aid Schools ...	13	732	351	47·9
Province of Uva.				
Government Schools ...	11	938	525	55·9
Grant-in-Aid Schools ...	28	1,761	1,044	59·2
Grand Total ...	369	34,317	20,893	60·8

Compared with the previous year, the numbers enrolled in Government and Grant-in-Aid Schools show in the aggregate an increase of 885 scholars, but this increase is largely due to the opening of several Aided Schools. The numbers in Government Schools show in general no increase worth recording. Indeed, in the case of one of the Provinces, the North-Western, there is noticeable a decrease of 237.

The average daily attendance in all schools is at present about 60 per cent. of the number on list. An analysis of the figures for the several Provinces shows that in the case of Government Schools of the Kandy District regularity of attendance has been well maintained during the year, being about 62 per cent. The Matale District, however, gives the best results in this respect, being close upon 65 per cent. The North-Central Province has 61 per cent. to its credit. In Grant-in-Aid Schools the regularity of attendance in all the Provinces but the North-Central may be considered fairly satisfactory. For the Kandy District it was 61·8.

A new feature will be found in the several excellent buildings provided for Government Schools entirely through local effort. These buildings are of solid construction with masonry pillars and tiled roof. Teacher's room, kitchen, and other necessary conveniences have also been provided. Most of these buildings have already been completed. Amongst these new buildings I may mention those at Hedeniya, Nugawela, Rambukpitiya, Pujapitiya, Bulupitiya, Kirimetiyana, and Alutnuwara. To meet growing requirements some of the buildings have been enlarged, such as those at Kadugannawa, Peradeniya, Madawalatenna, Weuda, Urugala, and Naranpanawa. Through the liberality, too, of the local authority some of the schools have been allowed playgrounds provided at great expense and labour. One of them is the fine playground given to the Government School at Nildandahinna. In the North-Central Province the spacious and commodious school bungalows, often large enough to accommodate as many as four or five hundred children, are excellently adapted to the wants of the district. They are straw-thatched and are cool and pleasant to work in. Altogether I must say the material condition of a great many of our schools has decidedly improved.

In the Central Province, during the year, the school at Pattiyagama was closed. It used to be attended by both Sinhalese- and Tamil-speaking children, but this arrangement was never found to work satisfactorily.

Among new schools opened I may mention those at Uduwa in the Central Province, Kudiyirippu in the North-Western Province, Kapugollewa and Halmillewa in the North-Central Province, and Kotabowa in Uva. The last-named school was opened as a Tamil School for Mohammedan children, but because the parents, in disregard of their promise, took no interest whatever in the school it was thought that it might be worked more satisfactorily if converted into a Sinhalese school, and so a Sinhalese teacher was placed in charge.

In the whole of this district there are about 17,250 Moor children of school-going age. The Moors, however, have not hitherto evinced any great desire to have their children instructed in Tamil, being content with their own verandah schools. Such applications for Mohammedan schools as have come before the Department from time to time are from "alims" or teachers of these schools, who most probably have been influenced in making these applications by the expectation of being taken on as teachers by Government.

There have been 63 applications for aid to new schools. Of this number, 26 were accepted within the year; the rest have either been refused or are awaiting the completion of their probationary period for final disposal.

To provide education for the backward districts of Uva the Gansabhawas, under the auspices of the Government Agent of the Province, have opened four schools. These schools are independent of Government support. They depend at present for funds on voluntary subscriptions locally raised. Of the four schools, one is a bi-lingual school at Koslanda, the other three are Vernacular schools. The remuneration offered is fair, and I have had no difficulty so far in persuading certificated teachers to accept service under these Gansabhawas. In any movement of this sort one of the main factors which go to make it a success is local sympathy and support. This is undoubtedly secured here. The Gansabhawa authorities will see that the schools for which they pay are well filled and well taught.

Instruction in English Schools.

Instruction in English is at present given in schools of three different grades: English schools; English schools on a vernacular basis, in which the medium of instruction is the vernacular; and Bi-lingual schools, in which English is taught in some of the higher standards side by side with the vernacular. Of English schools there are 16 in this district, and the number of scholars on the roll amounts to 1,841. On the assumption that the home language of the pupils attending these schools is English, the instruction given in them is entirely by means of the English language. As a fact, however, far the larger number of the scholars do not habitually use English. In consequence instruction under this head has been unsatisfactory. It must be confessed, too, that the requirements of the Code do not make for much improvement in this respect. Under the head "Reading" the class book in use was made easier about two years ago. The results of examination have therefore been very much better, but the improvement is more apparent than real. It is to be observed, further, that the whole course of a child's reading is confined to one set of readers. The reading book for the year is read and re-read with great minuteness, yet the instruction therein is of a remarkably narrow range. The vocabulary at the child's command is of the smallest, and when asked to give the substance of the passage read in his own words, he finds himself at a loss for any he can call his own. It would be better, I think, to have several sets of readers, as used to be the case some years ago, and that the questioning be more on the contents of the book than on the meaning of particular sentences or phrases. It would be well, too, to bear in mind that a child is often better helped by being put in the way of finding things out for himself by comparison and question than by being told them directly. It is on this account that I suggest that as an alternative course we adopt the "Narrative Series of Readers." The adoption of this or any similar sets of readers would be better than a continuance of the system now in vogue.

In Arithmetic it will be generally conceded that up to the Fifth Standard the work is excellent, but above this there is a falling off in the general quality of the work, the result, I think, of over much insistance on mere accuracy—a *sine qua non* for a pass under the old "Instructions"—

independently of method. Oral instruction in Arithmetic, on which so much depends, is altogether unknown in many schools.

The higher uses of the Dictation lesson are now being gradually recognized by the junior masters.

The teaching of History and Geography is much more methodical than it used to be. There is not much of that wild answering that was so common. But no true progress or permanent results in any of the above subjects can be attained, unless in teaching them the correlation of subjects is kept in view.

Much of what has been said of English schools applies also to English schools on a vernacular basis. There are in this district 24 such schools, with 2,247 scholars on roll. It is essential in these schools that the teacher should have a fair knowledge of the vernacular. Unfortunately this is more the exception than the rule, and hence much of the practical value of these schools is lost. Translation is taught quite unsystematically and in a desultory fashion. One reason for this is the want of good text-books for teaching English composition through Sinhalese, as we find in the case of Latin and English. The Sinhalese or Tamil lad, thrown on his own resources, never discriminates between the different idioms, and generally renders them literally. Hence the local errors of idiom. There is a general impression that vernacular and English instruction ought to be kept apart as far as possible, if English is to be effectually taught, and that the intermixture of the two languages fosters a tendency to make a child think in the vernacular and write in English. That this is contrary to fact, experience tell us; for it has been no uncommon thing amongst us to find excellent familiarity with English in combination with a sound knowledge of the vernacular.

Bi-lingual schools are mostly Government schools, and have only recently been started. So far they seem to be an improvement on our old Anglo-Vernacular schools. Under the head "Composition" conversation in English has been found possible, thus awakening the child's mind to the importance of the various parts of speech and the force of prepositions, adverbs, and the like.

Instruction in Vernacular Schools.

I should like to see all Vernacular schools divided into two departments, the lower one to be called the Infant Department and to consist of the present Alphabet Class and the First Standard. The minimum number of hours constituting a Government attendance is three. In the case of the Infant Department it might well be two. In teaching Reading to the Infant Class vernacular teachers in Government schools have found the phonetic method most helpful. The new syllabus of instruction for this class, recently introduced, has revealed some curious facts. Generally speaking, village children are able to distinguish only between red, white, and black. Every other colour is referred to by them in terms of one or other of those colours. This is true even of the older pupils. In respect of "form" and "shape," too, their ideas seem to be very rudimentary. Object lessons therefore cannot but be of the highest educational value, and these are being gradually introduced into all the standards. These object lessons become all the more valuable when it is remembered how few are the vernacular class books available at present.

Estate Schools.

To my Assistant Mr. Welayden's very full account given below I have only to add that, compared with other Vernacular schools, these Estate schools are most generously treated. They get a double grant up to a certain limit. The reason why many more schools of this class have not been registered may be gathered from the following quotations from letters of Managers to the Director :—

(1) "I have to report with much regret that we have found it necessary to close ——— school; we find it impossible to get the children early enough in the afternoon to fulfil the Government regulations," &c.

(2) "Our reason for making it a night school may commend it to your consideration. There are not many children on the estate who do not work during the day," &c.

One curious feature about these schools is that in several of them instruction in English is given after school hours. I am told that without this inducement cooly children would not attend.

Mr. Welayden's Report referred to.

With the five newly-opened schools on Asgiriya, Alakola, Gonagala, Marlborough, and Kotiyagala, there were in all 43 Estate schools in operation at the close of the year 1902, against 42 in the preceding year. Of these, 36 were in the Central Province, 6 in Uva, and 1 in the North-Western Province. The total number of pupils on the rolls of these schools was 1,840. The aggregate average attendance was 1,132, or 61 per cent. of the roll, against 59 last year.

Up to a recent time several of the Estate schools were held in rooms, in bazaars, and cooly lines, but now I am glad to report that all schools, except three, possess their own buildings with accommodation to meet the required purposes.

The results of the examination of these schools cannot be called quite satisfactory. The Reading and Writing are fairly good. The Arithmetic, though there is a slight improvement after the standard was lowered, is still poor. The poor results in this subject as well as in Geography are largely due to careless and unmethodical teaching. The children are bright and intelligent and have an aptitude to learn these subjects, but the majority of the teachers do not teach them intelligently. All the schools now have maps, but very little use is made of them. A child can tell all the towns on a river, but can seldom trace the course of the river on a map.

After provision was made in the Code for bonuses to teachers for drill I am glad that many schools have included it in the curriculum, and five out of eleven schools which took

up this subject had very good drill taught in a sufficiently regular and systematic manner to enable me to recommend bonuses to the teachers. One of them, Dikoya, had besides been taught action songs.

Of the 43 schools, 2 are directly under Government, 29 under the Tamil Cooly Mission, 4 under the Wesleyan Mission, 2 under the Friends' Foreign Mission, and 6 under private management.

These schools are granted all the privileges which the Code allows for (C) schools intended for backward and sparsely populated districts, except that the grant is limited to Rs. 300. Three schools, viz., Middleton, Hauteville, and Dikoya, exceeded this limit.

Tea plucking affords remunerative employment for children, and parents naturally prefer their earning money to learning, and in the absence of any regulation for compulsory education Estate schools have become possible only where the planters are generous enough to let off the school children from work an hour or two earlier.

Drill.

Both my assistants are agreed that in the interests of the children attending school and the teachers themselves a uniform system of drill is highly desirable. The present Departmental Handbook on Drill is unsatisfactory; but as instruction in drill under the "Model Course of Physical Training" for English Elementary Schools has been changed, I have deferred taking any action in this matter for the present.

XXIV.—REPORT OF MR. C. DRIEBERG, SUPERINTENDENT OF SCHOOL GARDENS.

In the course of my inspections I visited ninety-seven schools during the year. At the end of last year (1901) there were only five schools working under the scheme; there are now thirty-six.

In the Western Province gardens have been started in connection with twelve schools. Of these, I would mention Jamburaliya, Kiriwattuduwa, Kumbaloluwa, Handapangoda, Mugurugampola, and Danowita as being fairly well established and working satisfactorily. The main difficulty in the Western Province is in connection with school premises, which in many cases belong to villagers who, now that gardens have been established, are raising objections to their land—so long lying idle—being utilized for the purpose.

In the North-Western Province gardens have been started in connection with seven schools. Of these, Weuda, Medagama, and Kirimetiyana are doing good work. The Assistant Government Agent of Chilaw has taken a personal interest in the development of the scheme. An application for the services of a gardener—to remain for some time at each school and demonstrate practical details—was made by the Government Agent, who guarantees a salary from the Village Tribunal funds. I would recommend that the services of the head gardener in the stock garden be allowed in such cases, and the vacancy on the staff filled by the employment of a temporary hand.

In the Province of Sabaragamuwa gardens have been started in connection with nine schools. Of these, Hatela and Illukkumbura have shown the best work, but the rest are making satisfactory progress. Here Crown land, as a rule, is provided, or land is procurable from the chiefs, who are interested in the scheme. In this connection I would specially mention the support given by the Ratemahatmaya of Meda and Kadawatu korales.

In the Central Province gardens have been started at five schools, and of these, Tenna, Nugawela, and Gunnepana are the best. As is to be expected, the climate is in favour of the gardens, but I have found it necessary to suppress a too great tendency to develop the ornamental side of school gardening. The Assistant Government Agent at Matale has secured additional land for Tenna school, and has offered the boys a prize for gardening.

In the Southern Province three gardens were started in connection with Narandeniya, Talpawila, and Elakaka, and all are working well.

In the North-Central Province, which was visited in the latter part of the year, and where three schools were selected, there is a good field for work. The Government Agent is specially interested in the scheme, land is available, and provision has been made for the cleaning and annual repairing of fences, &c. (as in the Province of Sabaragamuwa), with Gansabhawa labour. The short supply of water is the only serious drawback, as is the case in the North-Western Province also.

The following returns are furnished to me by the teachers:—

A.—A monthly return showing attendance at garden work, the nature of the work done, &c.
B.—A monthly financial return.
C.—A quarterly return giving particulars of crops grown, &c.

The following is a summary of the financial returns furnished in 1902.

Profits were shown by Jamburaliya (Rs. 2·10), Kumbaloluwa (Rs. 20·09), Tenna (Rs. 4·88), Dippitigala (Rs. 12·85), Wariyapola (Rs. 7·52), Pinnawala (Rs. 6·97), Yakella (Rs. 5·15), Pannala (Rs. 21·32), Mugurugampola (Rs. 20·34), Kahatuduwa (Rs. 2·08). Nikaweratiya and Wataraka showed neither profit nor loss, while there was a deficit in the case of the following:—Kiriwattuduwa (Rs. 22·13), Handapangoda (Rs. 9·02), Weuda (Re. 1·41), Nugawela (Rs. 1·52), Danowita (Rs. 27·15), Talpawila (Rs. 2·36), Rikillagasgoda (Rs. 8), Dorawaka (Rs. 11·11), Galahitiyawa (Rs 6·12).

The utility of the gardens cannot, particularly at this early stage, be gauged by receipts or profits, as in most cases they are situated in remote parts of the Island, where they are calculated to do more good than if close to market centres. In such cases, therefore, a market has yet to spring up for the products introduced through and grown in the school gardens. It is indeed one of the objects of the scheme to create a demand for such products, and better financial results are bound to follow as the scheme matures. It should further be borne in mind that, besides the implements and seeds supplied to them, the teachers receive no financial aid, and are not permitted to employ and charge for hired labour: all the operations in the garden have to be performed by the scholars themselves. The additional work demanded of teachers in connection with this scheme is of a special and, in most cases, of an exacting nature, and it is not unreasonable that they should expect some recognition of

that work when satisfactorily performed: for if ornamental gardening among Railway Station Masters is considered worthy of encouragement by the offer of prizes, much more so is economic gardening among schoolmasters deserving of recognition and reward. At the same time the school children must also be encouraged, and an annual distribution of prizes should act as a great incentive to good work.

In the Review of the Imperial Department of Agriculture for the West Indies (6th December, 1902) occurs the following reference to the work done in the Colonies:—"In Trinidad it is satisfying to find that there are now 149 school gardens in the Colony, of which no less than 78 were of sufficient merit to obtain the Government bonus at the last examination." It would be an excellent thing if the Department of Public Instruction in Ceylon made school gardening a subject for the Government grant. Such a step would strengthen my hands and give impetus to the development of the scheme.

The resolution of the Colombo Agri-Horticultural Society to hold Village Shows (the benefits of which it is unnecessary for me to enlarge on) and to award prizes for school gardens will materially help on the scheme. I am also sanguine of raising a fund for providing prizes for school children. So that there is a prospect of the good work of both teachers and scholars being recognized from outside the Department.

I shall now proceed to deal with the question, "What practical purpose do these school gardens serve?" They constitute in each Province so many centres from which the people can obtain seeds and plants of edible and otherwise useful products. Whether from lack of energy or opportunity, it is beyond the power of the villager to procure for himself such seeds and plants from the Botanic Gardens or other local or foreign source as it would be to his advantage to have. The occasional distribution of seeds through headmen is attended by very uncertain results, and only where a Government Agent or his Assistant has taken a personal interest in seed distribution has any definite advantage followed. In consequence there has been no appreciable change, either as regards variety or quality of produce, in village cultivation for many years past, and such improvement as there has been is of a local nature, as arising from special local influence. Now, however, the school gardens serve as agencies between the village and the central stock garden and, through the latter, all other possible sources of seed supply.

In this way each garden is a means of bringing to the notice of the people such improved and new varieties of plants as are suitable for cultivation by them. The mutiplication of food crops, particularly in districts where the ordinary diet of the people is lacking in quality and variety, is, it will be readily admitted, an important factor in sanitary reform, and the school garden scheme has provided the organization for effecting this.

Further, the school garden serves as an object lesson, inasmuch as it gives the people an opportunity of seeing the actual cultivation of the seeds distributed; and this is of the greatest importance, as the village cultivator, proverbially conservative, could not afford, even if he desired, to indulge in experiment.

Through the central stock garden the school gardens provide for the exchange of seed, so important an element in the improvement of crops, by which the best seeds of one district are introduced into another and *vice versâ*. In terms of a Circular I have issued with reference to the selection and preservation of seed, one-third of the selected seed is retained for future use in the school garden, one-third distributed among the children and their parents, and the remaining third transmitted to me.

In this connection I might mention that the collection and selection, drying and storing, packing and distributing of seed, constitute one of the chief duties of the Manager of the Stock Garden, who also keeps a record of all seeds distributed.

My travels in the interior have brought to my knowledge many little known facts, and afforded me the opportunity of discovering and supplying the wants of particular localities. In some parts such invaluable trees as jak and breadfruit are not seen, though the people can ill-afford to be without them, the radish has never been heard of, and no use is being made of such common vegetables as bandakkai (*Hibiscus esculentus*) and alanga (*Ipomœa muricata*); and yet the people are content to eat the flower buds of kahata (*Careya arborea*) and other wild products of unknown food value. A visitor from the Gold Coast, whom I supplied with a collection of native vegetable seeds, recognized among them species that were found in West Africa, but the uses of which were unknown. The same state of affairs exists in parts of the Island, which for want of exploiting by an agricultural official have so long remained ignorant of the value of many edible products. But the constant supply of seed of native vegetables, exotics possible of cultivation, and new varieties introduced from abroad (some of which like Australian spinach—*Chenopodium album*—have taken to the soil with the people) that has gone out to the school gardens has done a great deal towards meeting the wants of the country districts. The useful work done in this way it is of course not possible to gauge at present, but should be soon apparent.

In 1896 the Indian Government felt justified in expending a sum of no less than Rs. 108,000 in the purchase of carrot seed for free distribution throughout India. With the knowledge—through printed reports—of the unfortunate history of this magnificent experiment, I venture to think our system of supplying seed through the agency of the school gardens, where, however, their cultivation is demonstrated, is a surer, if less conspicuous means of inducing the village cultivator to grow a larger variety and better quality of food crops.

In the stock garden I am making as complete as possible a collection of native and foreign varieties of the yam, the cultivation of which cannot, I think, be too largely taken up in the outlying parts of the Island.

Besides vegetables, the school gardens are growing fruits suitable for cultivation in the different localities, so that it will not be long before there will exist at each school garden so many agencies in the shape of fruiting trees for the extension of fruit cultivation in the Island.

At present fruits like the sapodilla (*Achras Sapota*), which, as in Calcutta, should when in season be found in quantities in our markets, are rarely seen, and the tree is only found growing in old gardens.

The plants for the nursery of fruit trees in the stock garden were supplied by the Royal Botanic Gardens, as well as raised from seed. From Mr. W. H. Wright of Mirigama I received seeds of the excellent mangosteens grown by him, from the Trinidad Botanic Garden seeds of a highly recommended guava, from the Agricultural Department of Queensland eight of the best varieties of

bananas grown in that Colony. The bananas are now well established in the stock garden, and are already throwing out shoots, which will be shortly available for distribution. The varieties received are named "Ladies' fingers," "Sugar," "Moku," "Butter," "Delana," and "Decca." I am expecting a further supply of banana plants from Fiji. From the Director-General of Agriculture for India I have received three varieties of American sweet potatoes found suitable for cultivation in India, viz., the "Nancimond," "New Jersey," and "Virginia." These I hope to gradually spread about the country.

The Ceylon goiya is not, as is generally supposed, an expert market gardener. The contrary is only true of special communities and districts, where a knowledge of horticulture, as of carpentry or basket-making, may be said to be hereditary. So that technical instruction in this, as in other industrial occupations, must be recognized as supplying a want which, though it may not be popularly admitted, really exists.

In addition to the advantages of school gardening as a desirable occupation for children from a physical, sanitary, and recreative point of view, there is the advantage that must follow a study of plants and the details of their cultivation and growth, and the opportunities afforded for observation and reasoning on lines suggested by such study. I am convinced that the children who work in school gardens are acquiring much useful information of a practical character.

With the idea of developing the educational side of the scheme, pamphlets and leaflets in English and Sinhalese have been printed and freely circulated. The first, prepared by the Director of Botanic Gardens, treats of school gardens and nature study. The laying out of a garden was the subject of a leaflet written by me, and I have also prepared a junior and senior course in the study of plant life. The Government Entomologist has contributed a Paper on the Silkworm and Silk.

An attempt is being made (through the agency of school gardens) to popularize sericulture as home industry in the villages. I have supplied twenty-eight schools with mulberry cuttings for providing a stock of food for the silkworms. A few schools were also supplied with silkworm eggs provided by Mr. Green, but these failed to hatch out owing to the eggs not having been previously subjected to refrigeration. It is intended to shortly distribute a fresh lot of eggs after the necessary refrigeration. In the meantime I have placed myself in communication with Professor Mukerji, an Indian authority on Sericulture, as well as the Principal of the Sericultural School at Rampur Boalia, Rajshahi, with a view to drawing supplies of eggs from India.

In Apiculture the experimental working of a frame hive is still being continued. Through this means I have gained some useful information in the management of Ceylon bees. Though my efforts to induce the bees to store honey in a "super" have proved unsuccessful, it is a satisfaction to know that they can be sufficiently domesticated to build in frames, and that there is a prospect of rational method of keeping bees for honey and wax, displacing the rough and ready devices in vogue among the natives, necessitating the employment of drastic measures for securing the honey and resulting in the loss of valuable insect life. The garden honey I have produced has proved to be infinitely superior to ordinary wild honey. Not the least important aspect of the experiment in Apiculture is the possible advantage of bee-keeping to the Planting industry, as insuring more certain fertilization in the case of fruit-bearing crops.

A complete set of grafting and budding tools was procured from Messrs. Carter & Sons, London, and they are at present being used in the stock garden before utilizing them for demonstrations at school gardens.

I have made a number of experiments with insecticides and fungicides and the means of applying them, and have devised a convenient hand pump with "cyclone nozzle" attachment for delivering sprays in the form of a mist. I was led to do this in consequence of "knapsack" spraying machines proving too cumbersome for work out here. I am keeping a stock of materials for making up kerosine emulsion and Bordeaux solution for use in school gardens whenever necessary. As a cheap and non-poisonous insecticide I recommend a mixture of castor oil and soap, emulsified with the aid of carbonate of soda. As both the oil and soap are procurable by teachers, it would only be necessary to supply them with the carbonate, which is cheap enough and can be forwarded in parcel form through the post, thus doing away with the inconvenience of having to send fluid preparations.

The treatment of betel disease has also received my attention. In December I took in hand a diseased plot of betel in Jawatta, situated at a convenient distance from my office, and visited the garden often while it was under treatment. I am glad to report that the measures adopted by me were attended with very satisfactory results.

In conclusion, I should wish to acknowledge the service of my only assistant, Mr. Alexander Perera, who has done good work both in the stock garden and my office.

ADDENDUM BY MR. J. HARWARD, ACTING DIRECTOR OF PUBLIC INSTRUCION.

THE CENSUS AND EDUCATION.

The detailed figures of the Census Report for 1901 have been awaited with much interest by those who are anxious to estimate the work that remains to be done before the provision made for the education of the Island can be considered satisfactory. It is disappointing to find that the Municipality of Colombo is the only part of the Island for which figures were collected of those actually attending school. In the criticism of the educational work of the Island as a whole, the author of the report has relied on the figures collected by this Department. These are reliable in the Government and Aided Schools; but the numbers returned by unregistered schools (about 16 per cent. of the total) are untrustworthy, and it would have been interesting to have them checked by an independent enumeration. The literacy tables afford data for estimating what return there is to show for educational work in the past; and Table LXXIV., which gives the population of every village with age statistics, ought to be a valuable help in guiding the efforts of the future.

In Colombo the total of those receiving education is 9,747. In 1891 it was 9,413 ; so that there is an increase of only 3·5 per cent. for a period during which the population has increased by 22 per cent. The wants of Colombo have been dealt with in more than one of the recent Administration Reports of this Department. In the early part of 1899 an estimate based on personal inspection of most of the unregistered schools or departmental figures for registered schools gave 9,800 as an outside estimate for those receiving anything at all in the way of education (see Administration Report 1898, page 16). The close approximation of this figure to the total furnished by the Census is a guarantee for the reliability of both. The want of progress is noteworthy, but not surprising. As there has certainly been a large increase in the number of those attending English schools, there must have been an actual decrease in the number of those attending elementary vernacular schools. In other words, there are more children running wild about the streets than there were ten years ago. What ought to be the number of those at school? The Census says 32,045, or 20 per cent. of the total population. But Table L., which gives this figure, is based on the fiction that the school-going age is five to fifteen. Perhaps six years may be assumed as a fair average for the period during which town children should be under discipline and instruction ; this would give 12 per cent. of the population, or about 18,500 as an approximate total of those who ought to be at school. The existing accommodation in all the unaided and many of the aided vernacular schools is too miserable for words, and 12,000 is the lowest estimate of the number for which proper accommodation still has to be provided. To provide this accommodation, with adequate allowance of space, light, and air, to enforce a system of compulsory attendance, or to contribute a portion of the working expenses, are duties which must be thrown on the local authorities of Colombo, either on the existing authority or on one specially created for the purpose. There is no other way out of a position, which is at present a disgrace to the Colony ; and the longer it is delayed the greater will be the expense of providing sites and buildings.

The Census Report deals with the educational provision for the Island as a whole in the following passage :—

> There were in Ceylon, according to Table XXII., 465,513 males and 401,590 females, or a total of 867,103 of the school age. The Director in his annual report estimates that in 1901 there were 218,479 children under instruction. Thus, about three-fourths of the children of school age, numbering about 650,000, do not attend schools.

It is a pity that this passage is so easy to quote, as it is quoted here, apart from its context. It gives a most misleading picture of the general condition of this Island ; and if it were true, the Colony would have to face the pleasing prospect of an educational vote rising to four times its present amount. The context informs us that the school age "for convenience has been taken as five to fifteen years." But who is likely to quote or consider the context? The convenience of the assumption lies in the fact that it enables exact figures to be drawn from the age tables of the Census Reports ; and if it were true that the average period for which children attend school in Ceylon is exactly ten years, the exact figures would have a value. But if it is altogether wide of the mark, every figure that is based on this assumption, however exact, is an imaginary quantity. Surely it would have been better to make an approximate calculation as to the actual average duration of the school age? By using this in conjunction with the age tables it would have been possible to make an estimate of the number of those who are getting no education at all. Such an estimate, though only approximate, would have had a real value. It is not impossible to find out the average duration of school attendance in Ceylon. This Department has for many years published the details of those presented for examination in the various standards. The totals for 1901 were as follows :—

Standard I. ...	... 30,159	Standard V. ...	... 7,255
Standard II. ...	... 24,787	Standard VI. ...	... 3,454
Standard III. ...	... 17,891	Standard VII....	... 1,623
Standard IV. ...	... 12,032	Standard VIII.	... 900

A calculation based on these figures for the eight years 1894–1901, after making allowance for extra time spent in the first standard and for second presentations, gives 3·9 years as the average school life of those who are presented for examination. Those who are not presented for examination fall into three groups : (1) those above the standards whose school life is much longer, but whose number is relatively few ; (2) those not qualified for presentation through insufficient attendance or other cause, whose average school life is probably the same as that of their school-fellows ; (3) those belonging to unaided schools whose average school life is certainly shorter. On the whole, we shall not be far wrong if we consider that groups (1) and (3) balance one another, and that four years is approximately the average length of school life in Ceylon. Those who have been much in vernacular schools and have seen what large numbers leave after passing the Third, Second, and even the First Standards will probably agree that four years is not an under-estimate.

Now, if every child received four years of education, the number at school would be approximately four-tenths of the number between the ages of five and fifteen, or 346,841. The actual number receiving instruction in 1901 was 218,479, or a little less than 63 per cent. of this. As a rough estimate we may say that three-fifths of the children are getting some education and two-fifths of them are getting none.

What would it cost to complete the work? With compulsory education and a minimum of five years for school life (which is about what is suitable for rural districts) we should have probably an average school life of six years for the Island ; this would give about 520,000 children at school, or 300,000 more than we have at present. The cost of educating them at Rs. 3·50 each would be Rs. 1,050,000. Allow Rs. 150,000 for extra expenditure on the training of teachers, departmental machinery, and other charges, and we have a total of Rs. 1,200,000 to add to the total expended in 1901, which was Rs. 907,595. The result is that to do the work of elementary education, without making additional provision for higher education, the votes of the Department require to be raised to a little over Rs. 2,000,000. Perhaps the Educational Cess Committee have formulated some scheme for reducing this. The experiment of Gansabhawa schools in Tamankaduwa justifies the hope that some more economical way of dealing with certain rural districts can be found ; a similar experiment has just been started in Uva.

What return is there to show for the educational work done by this Department and other agencies in Ceylon? The literacy tables of the Census afford data for answering this question. The general result is as follows:—

	Population.	Percentage able to Read and Write any Language.
1881	2,759,738	15·7
1891	3,007,789	19·9
1901	3,565,954	21·7

At first sight the rate of progress seems miserably slow, and the critic is tempted to ask: "Is this all you have to show in return for the expenditure on education?" It is desirable that these figures should be supplemented by some calculation of the progress which might fairly have been expected during the twenty years for which figures are available. From the age and life tables of the Census, taken in conjunction with the number of children who have passed through the schools, it is possible to find out deductively what the number of literates ought to have been in 1891 and 1901. In 1881 the percentage of literates was 15·7 of the population, *i.e.*, 433,278. The average annual death-rate during those years was 24·3 per thousand, so that 105,291 may be presumed to have died in ten years; this leaves a balance 327,987 surviving in 1891. Assuming four years as the average duration of school life, we get 287,541 as the number of literates that ought to have been produced by the schools during the years 1881–1891; deducting 13,225 on account of death-rate (at an average rate of 4·6), we have a balance 274,316. This gives a total of 602,303, or 20·02 per cent. of the population in 1891. The actual percentage in 1891 was 19·9, so that the difference is only ·12 per cent. of the entire population. The deficit is 3,609 persons out of 602,303, so that the schools have produced over 99 per cent. of the number of literates that might have been expected of them. If the same calculation be applied to the next decade, we get as the total number of literates that might be expected 837,946, or 23·49 per cent. of the population. The actual percentage in 1901 is only 21·7, so that we have a more serious shortage of 1·79 per cent. on the entire population, or 63,829 persons. This is partly to be accounted for by the immigration tables. During the years 1881–1891 there was a small decrease on the Indian-born population of Ceylon; during the years 1891–1901 it rose from 264,580 to 436,622. If the difference 172,042 is divided into the proper proportions of males and females, and the difference between the Indian and Ceylon rates of literacy be computed, it will be found to account for a deficit of 23,845. This still leaves a deficit of 39,984 out of a possible total 814,101, which may be put down to failures on the part of the schools. But the total number of literates is still over 95 per cent. of the number that might have been expected.

It would not be right to leave the Census Report without adding that its general remarks on English education and higher education, though severe, are most valuable and deserve careful consideration from Government and from the organizers of education. The defects which it points out in elementary English education are almost identical with those that have been most fully dealt with in Administration Reports and lectures by Mr. Burrows, who has initiated practical steps for remedying many of them; but improvement can only come with time and with the employment of trained teachers. As regards higher education, the criticism amounts, in brief, to this: "We have no higher education in Ceylon; we ought to have it, but if we want it we must be prepared to pay for it." This seems to give scanty recognition to the efforts of those who, at the cost of no small degree of personal devotion, have attempted to give their pupils such a school education as would give them something like a fair start in an English University. When, however, it is explained that by higher education is meant University education, the criticism is both just and valuable. Our colleges are only schools, and we have no provision for anything except school education. If there is to be any scheme for taking up a University course which is something more than a mere name, it must include as its central feature the provision of higher teaching on a somewhat extensive scale.

FINANCIAL SUMMARY, 1902.

	1901. Rs. c.	1902. Rs. c.
Amount voted	934,628 66	1,000,370 8
Amount expended...	907,595 56	952,273 31
Unexpended balance ...	27,033 10	48,096 77

The total amount voted for the services of the Department in 1902 was Rs. 1,000,370·08, of which a sum of Rs. 952,273·31 was expended during the year. The unexpended balance amounted to Rs. 48,096·77, representing Rs. 8,221 under "Personal Emoluments" and Rs. 39,875·77 under "Other Charges."

The savings under "Personal Emoluments" are due chiefly to leave granted to teachers on half pay and no pay, as also to votes for new schools not being fully utilized, and to the closure of a few schools.

Under "Other Charges" the whole of the vote of Rs. 10,778 for grants in aid to Training Schools and Rs. 13,220·37 from the vote for Grant-in-Aid Schools lapsed to revenue, as it was not possible to collate the results of the examinations in time for payment within the year. Rs. 5,000 out of the vote for providing additional accommodation at the Maggona Reformatory, Rs. 500 voted under grant to itinerating teachers in Uva, and Rs. 500 voted for the preparation of a Geography for Ceylon schools had not been earned at the end of the year and consequently lapsed. Rs. 5,791·48 saved from the vote "Expenses connected with the Technical College" was mainly due to the non-receipt of some of the articles indented for from England during 1902. Rs. 4,329·91 under "Allowance of Monitors and Bonus to Head Teachers in Government Schools" was also saved.

The gross expenditure of the Department when compared with that of the previous year shows an increase of Rs. 44,677·75. The nett expenditure of 1902, after deducting receipts from school fees,

sale of books, and stationery, &c., amounted to Rs. 905,616·58, showing an increase of Rs. 45,432·62 over that of 1901. The receipts from school fees, sale of books, and stationery, &c., during the year amounted to Rs. 46,656·73, and show a decrease of Rs. 754·87 as compared with those of 1901.

The following is a comparative statement showing the receipts and expenditure of the Department during the last two years :—

RECEIPTS.	1901. Rs. c.		1902. Rs. c.	
Amount received as school fees, Royal College	19,775 0	...	20,135 0	
Amount received as school fees, Technical College	7,945 0	...	5,757 50	
Amount received as school and boarding fees, School of Agriculture ...	73 63	...	—	
Amount received as school fees, Primary and Middle English Schools ...	2,340 17	...	1,917 0	
Amount recovered by sale of stationery	1,888 40	...	1,875 84	
Amount recovered by sale of books ...	15,159 40	...	15,121 39	
Amount received as examination fees...	230 0	...	1,850 0	
Nett receipts on account of votes ...	860,183 96	...	905,616 58

No. 2.—REPORT OF THE EXAMINERS on the Special Examination of certain Forms in the Royal College, Colombo, December, 1902.

Examination in Latin and English.

To the Secretary of the Local Examinations and Lectures Syndicate of the University of Cambridge.

SIR,—I BEG leave to submit to you my report on the above-named examination which I have recently conducted in accordance with your instructions :—

Latin.

Lower III. (*32 boys*).—A. R. de Silva and R. F. de Saram sent up very good, and eight other boys good papers. The great majority did at least fairly well in translating Latin sentences into English, but in Grammar and the translation of English sentences into Latin there was great variety in the quality of the work; and nearly half the papers were poor. The weakest points in Grammar were the answers on the passive voice and the participles. In the sentences Grammar was weaker than vocabulary. The boys should be warned against assuming that the first noun in a sentence, irrespective of its case, is the subject—an erroneous conclusion which some have practically drawn from the Latin sentences given in their exercise book.

Middle III. (*31 boys*).—Poulier, closely followed by a number of other boys, sent up excellent papers on Grammar, and only six boys failed to gain half marks. In the translation of English sentences into Latin and of Latin sentences into English, Poulier, Van Hoff, and Jayawardene are especially to be commended, and the work of the class in general was distinctly above the average. It was noticeable that many boys were more successful in writing Latin than English sentences.

Form III. 1 B (*26 boys*) was not quite so successful in Grammar as the form below, regard being had to its position in the school, the reason being that many of the boys found a difficulty in framing answers to the questions on syntax. The translation of English sentences into Latin, however, of T. A. de Silva, E. Dias, S. de Silva, and other boys deserves commendation, and the work of the form in general in that department of the paper reached a good average.

Form III. 1 A (*28 boys*), taking the same paper, in general acquitted itself in the same manner as Form III. 1 B; W. S. Fernando deserves especial notice, as having gained 114 marks out of 120; A. W. Peris, S. Somasundaram, closely followed by others, also sent up excellent papers.

These two forms also took up a translation paper. The translation from the prepared book (Gradatim) was very well done, bad mistakes in construing being the exception. The weakest point was the treatment of tenses. More attention should be paid by some boys to the conjunctions, which were omitted or inserted to fit in with the supposed sense. The parsing in general indicated a sound knowledge of Grammar, although it was not unfrequently defective in form. Many of the weaker boys did not attempt the unseen passage; a few of the better candidates sent up very creditable versions. Chellaturai in III. 1 B and Christoffelsz and Fernando in III. 1 A may be especially mentioned.

Form Lower V.—The answers in accidence were in general good; in syntax some were weak, others I thought failed to do themselves justice from a difficulty which they seemed to find in expressing themselves. In turning English sentences into Latin a creditable result was obtained, and there were no bad failures. In unprepared translation an easy passage of Cæsar was generally well done; a few lines from Phædrus puzzled most of the boys; a harder passage from Cæsar proved somewhat too difficult, but the attempts to translate it were based on right methods and showed good training in the language. The prepared book (Virgil, Æneid V.) seemed to me a difficult subject for the form; so subtle a poet as Virgil is a hard author for boys, many of whom have not a complete command of English, to translate. The translation showed careful teaching and commendable efforts on the part of the boys. The explanations of constructions were very fair, and a normal line was usually scanned correctly, but no one was successful with a spondaic line. The explanations of allusions were in most cases mediocre. Aldons was first in Grammar and Virgil, Ephraums in sentences, Jayasinghe in unprepared translation.

The staff may be congratulated on the main results of the examination in Latin.

English.

Dictation.—The exercises of the five forms in general reached a very satisfactory standard. Perhaps the commonest mistake was the omission of "d" or "ed" in past tenses and participles. The writing was in most cases good and neat. The upper division of the Third Form showed, in writing out a passage from Macaulay, acquaintance with a fairly extensive vocabulary, and the exercises of Lower V. were general well punctuated.

English Literature.—Forms Lower and Middle III. were with few exceptions able to quote a passage from *Boadicea* and to give in their own words the sense of a passage from *Lochinvar*, but being asked to quote the passage from Macaulay's *Armada* describing the receipt of the signal in London, the great majority wrote out another passage in its place. Nearly every candidate dealt successfully with some of the extracts set for explanation, but only a few could explain all of them. For these reasons the average marks gained were low. Van Geyzel sent up an excellent paper, the next best being A. H. Ernst and A. de Silva. The upper divisions of the form were examined on Macaulay's *Lays*. In III. 1 B there were some poor papers, and only five boys, of whom De Boer was the best, gained half marks. Many, however, quoted a passage correctly and gave its sense and explained certain extracts and phrases. The papers of III. 1 A showed a distinct advance, and especially those of De Kretser, Modder, A. W. Peris, T. W. Mendis, and Sripathmanathan. Form Lower V. was generally very successful in answering a question testing knowledge of the plot of *A Midsummer Night's Dream*, and fairly successful in giving in their own words the sense of an extract; some also explained allusions; a few only could deal with questions involving points of literary criticism. Eliatamby was first.

The marks gained in English Literature in the five forms were in most cases not high, but it is to be noted that passages committed to memory were usually written out very correctly, and their sense given in words, which fell indeed short of a close paraphrase—that I had not asked for—but yet showed that the boys appreciated the poems; moreover, few failed to explain a portion of the allusions or extracts contained in their papers. The poems studied by the Third Form, though in other respects most suitable, presented difficulties in the abundance of their allusions.

English Grammar.—Many of the boys in Lower III. gave good answers on the definitions and on analysis; they were in general much less successful in parsing and in picking out the subjects and objects in a verse extract. Many have still to learn the importance of considering the function of an English word in each sentence in which it occurs before stating the part of speech to which it belongs. Drieberg sent up the best paper. Middle III. in general answered satisfactorily questions on definitions and on accidence (except that on the verb); some also distinguished correctly between the various uses of certain pronouns. Many omitted the parsing; the work of those who attempted it was of very various quality. The analysis was generally attempted and done well by several, poorly by many. Jayawardene, H. V. Perera, and Mottau may be commended. Forms III. 1 B and A showed on the whole a marked advance on the work of the lower divisions, although there were a number of weak papers, and some omitted the parsing or analysis, while others who attempted these exercises had not mastered their principles. There were, on the other hand, especially in III. 1 A, a number of really good papers, and questions on definitions and accidence and on the uses of pronouns were in general well answered. The passage in reported speech—a useful exercise for the students—was correctly dealt with by only one boy. I would commend Sansoni, Fernando, and Somasundaram among the boys who sent up the good papers in III. 1 A. Form Lower V. acquitted itself decidedly well in Grammar, except that the passage for analysis baffled many of the boys, and the question on the introduction of words into the language from Latin was often inadequately treated. A very promising set of essays was sent up, and Aldons, Jayasinghe, Eliatamby, and Woutersz deserved commendation for their descriptions of scenes in Ceylon.

I have, &c.,

Countersigned on behalf of the Syndicate:

J. N. KEYNES,
Secretary.

To the Secretary of the Local Examinations and Lectures Syndicate of the University of Cambridge.

SIR,—I BEG leave to submit to you my report upon the examination of the Royal College, Colombo.

The examination of Lower V. and all divisions of III. gave very fair results in Geography, the chief weakness being in defining the position of places named and the course of rivers. In History a fair proportion did well in each form, but there was much vagueness as to the reigns with which persons and events were connected.

In Lower V. half the pupils did well in Geography, but there was a prevailing tendency to all including answers in giving products and exports, and uncertainty as to outline in sketching maps. In History good general knowledge was shown of the Anglo-Saxon and Norman periods, but much irrelevant matter was introduced in the answers.

Upper III. A, as a rule, did well in Geography. The chief features of Europe and Physical Geography of Great Britain were well known; more inaccuracy was shown in dealing with Ireland. The papers of Sripathmanathan and Samarasinghe deserve favourable notice. The former of these also did very good work in History, in which subject half the form did at least very fairly; the answers of the rest were vague and uncertain.

Upper III. B showed fair general knowledge of their Geography, but were not accurate in details; half did fairly well, many of the others poorly. In History the results were about the same, persons and reigns being confused by the majority of the boys.

The papers of Middle III. in Geography were on the whole good, though lacking in clearness in defining the course of a river and the locality of places. In History only a few did well, the majority being very uncertain as to the reigns in which events happened.

The answers of Lower III. in Geography were generally correct as far as they went, but too often lacked definiteness and completeness; very few, however, did badly. In History Ernst did good work, and nearly half the form showed fair knowledge of their period, but did not know how to arrange statements of facts. In some cases there were signs of attempted quotations of text-book or note-book, which were altogether irrelevant.

I have, &c.,

EDMUND ARBLASTER, M.A.,
Clare College, Cambridge.

Countersigned on behalf of the Syndicate:

J. H. FLATHER, M.A.,
Assistant Secretary.

To the Secretary of the Local Examinations and Lectures Syndicate of the University of Cambridge.

SIR,—I BEG to present to you the following report of my recent examination in Mathematical subjects of the Royal College, Colombo. The forms which submitted work for examination were the Lower Fifth, the Upper Third (Divisions A and B), the Middle Third, and the Lower Third. The subjects presented were Arithmetic, Algebra, and Euclid:—

Arithmetic.—A general paper, including questions on interest, present worth, percentages, and areas, was set to the Lower Fifth Form. The results, on the whole, were satisfactory, there being no

absolute failures, and all the boys showing themselves capable of dealing with complicated questions on vulgar and decimal fractions, and many in addition attacking the problems with success. A good deal of the work, however, was spoiled by inaccuracies in common operations. But for this, a higher average of marks would have been attained. With regard to the lower forms, great praise is due for the excellent standard attained. Most of the work was done in good style, and, but for a few accidental errors in calculation, with accuracy. One curious blemish of style, however, was noticeable in the Upper Third Form. In working out a question in practice, many boys used the method of practice to multiply a sum of money by 3, an excess of ingenuity which increased not only the length of the sum, but the liability to error. In fact, one boy just failed to get full marks for his paper by a mistake made in performing this unnecessary process. Omitting this flaw, the methods adopted throughout the paper were, as a rule, perfectly appropriate. In Division A two boys got full marks, two others 99 and 98 per cent. respectively, and three others more than 90. In Division B one boy got full marks, another 97, and a third 92. Of the rest, with three or four exceptions, the work was thoroughly satisfactory.

Very commendable papers were handed in by the Middle and the Lower Third Forms. In the Middle Third one boy got full marks, ten others gratifying percentages of the maximum, and the rest a fair average. The questions on fractions were well done, though some hesitation was revealed in dealing with recurring decimals. In the Lower Third three boys got full marks and three others only missed doing so by one or two marks, and the standard of the whole form was high. The number of instances in which full marks, or nearly so, were obtained was, as far as my experience goes, unusually high, and the school seems to deserve considerable credit for its arithmetical work.

Algebra.—The Lower Fifth Form were examined as far as quadratic equations. A question on simultaneous quadratic equations, and also a problem involving quadratics, were omitted by all, but the rest of the paper was answered in a creditable manner. The simplification of fractional expressions, the resolution of factors, and the extraction of square root were generally done, and several boys also succeeded with the problem on simple equations. In the Upper Third A three excellent papers were sent up, one of which obtained full marks and two others 97 and 93 per cent. respectively. The large majority of the remainder were good. In Division B the standard reached, though not so high, was satisfactory. The three best boys were equal in the number of marks obtained.

Euclid.—Nearly all the boys of the Lower Fifth Form showed a fair acquaintance with Euclid Books I. to IV., and an accurate appreciation of the methods of geometrical reasoning. Several were successful in solving the original problems, and two boys in particular acquitted themselves well in this respect. Both divisions of the Upper Third Form were examined in Book I., propositions 1 to 41. With two exceptions, every one wrote out correctly one or more propositions, and several attacked the riders with success. One boy in Division A distinguished himself by solving all of them, and but for the omission of an early proposition, left out probably for want of time, he would have obtained full marks. In Division B most of the boys seemed to understand their work, and many were capable also of giving original solutions. The first place was gained by a boy who solved three problems. His propositions, however, were not all accurately given, and he was in consequence closely pressed by a boy who wrote out all the propositions correctly, but only did one rider. In the Middle Third Form the first place was easily taken by a boy who reproduced all the propositions accurately and solved two riders. Of the others, only four failed to write out two at least of the four propositions contained in the paper, a very satisfactory proof of careful instruction in a difficult subject.

Summary.

Summing up the results of my examination, I have no hesitation in reporting that very excellent work in Arithmetic, Algebra, and Euclid has been done in these forms, and an extremely gratifying standard has been reached, which reflects great credit on masters and pupils.

I have, &c.,

J. G. EASTON, M.A.,
St. John's College, Cambridge.

February 7, 1903.

Countersigned on behalf of the Syndicate:

Assistant Secretary.

Report on the Reading of the Four Third Forms at the Royal College.

The aggregate number of marks possible of attainment was 50. The average obtained in each class was as follows:—

Form III. 1 A	35·3	Middle III.	32·8
Form III. 1 B	35·5	Lower III.	36·2

The reading was for the most part correct; only in a very few cases were mistakes made.

The average mark was in each case lowered considerably by a want of expression in the reading.

The continual dropping of the voice caused rendering of the passage read, in some cases, to be almost unintelligible. It would, I think, be well if, in order to allow of greater modulation, the boys were trained to pitch the voice in a higher key. In some cases the reading was too fast, and consequently the enunciation indistinct.

The vowel sounds suffered generally in pronunciation; short exercises in breathing and voice production before each lesson would, I think, be found beneficial.

The boys in each class were very ready in giving meaning of individual words; they seemed, however, to find it difficult to express a sentence in language of their own, even when able to give appropriate synonyms for each difficult word in the same sentence; when, however, I set a written test of this kind it was very well done indeed, proving that the defect was due rather to insufficient exercise in oral work of that description than to a lack of intelligence.

E. EVANS.

OXFORD AND CAMBRIDGE SCHOOL EXAMINATIONS.

To the Director of Public Instruction, Ceylon.

SIR,—WE are instructed to send you the following report on the examination for the English University Scholarship recently held at Colombo, under the authority of the Oxford and Cambridge Schools Examination Board.

The subjects of examination were:—

(*a*) English (8 candidates).
English History (8 candidates).
Examiner: E. de Selincourt, M.A., University College, Oxford.

(*b*) Mathematics (8 candidates).
Examiner: C. H. Thompson, M.A., Queen's College, Oxford.

(*c*) Chemistry (3 candidates).
Physics (5 candidates).
Examiner: A. F. Walden, M.A., New College, Oxford.

On the whole examination E. G. Mack is recommended for election to the Scholarship. The following showed special merit in the examination: Joseph in Mathematics, De Zilva in Chemistry and History, Thamotharam in Physics and History, Watson in Physics, and Siriwardene in History.

I. *General Remarks.*—(*a*) The work of the candidates in English was decidedly disappointing, and fell considerably below the standard attained in last year's examination. The essays were very unsatisfactory; they lacked both thoughtfulness and arrangement, and were written in a thoroughly slipshod manner. In many cases the spelling and punctuation were extremely bad; capital letters were introduced in the middle of sentences, and words were continually used in complete ignorance of their meaning. Many of these mistakes might have been avoided if the essays had been shorter, but the idea of most of the candidates was evidently to write as much as possible.

The answers to the English Language papers were also very weak. The logical part of the Grammar was fairly well done, but any questions that required the least knowledge of the earlier forms of the language were answered with hopeless inaccuracy, and the questions on poetic license and on metre were unsatisfactorily dealt with.

The English Literature was a little better: several candidates did good answers on Pope and on Bacon, but the Shakespeare was far less satisfactory than last year, and the general uncertainty in dealing with "contexts" showed that the set books had not been properly mastered. The best work was done, as last year, in History. The subject had evidently been read widely, and though many of the answers were marred by inaccuracy and a tendency to leave the point of the question, the answers showed, as a whole, a keen interest in the subject and a good grasp of it.

The best work in the examination was done by Mack, whose answers in History were excellent and in Literature good. I should mention as distinguished in the History paper Siriwardene, Thamotharam, and De Zilva.

(*b*) Of the eight candidates, one, E. G. Mack, was decidedly good, and did consistently well throughout. Joseph, too, did very good work in some papers, though his work was not uniform. Of the others, four were fair, two were rather weak.

Bookwork was in general well known and fairly written out. In Arithmetic considerable ability was shown in dealing with the harder problems, but sums requiring ordinary manipulation were apt to be done carelessly and cumbrously.

In Geometry bookwork and ordinary riders were generally well known.

In Trigonometry again weakness was shown in the elementary parts in cases where a little explanation was asked for.

The Algebra was fair. With two exceptions, the knowledge of Conics was poor. The paper in Dynamics was much better done than that in Statics; beyond bookwork most boys showed up little in Statics that was of any value. No candidate did well in Problems.

The handwriting of some candidates was bad, and the answers were careless and slovenly and very difficult to read.

E. G. Mack showed special merit in the examination, and V. Joseph also deserves mention.

(*c*) The general level of the work, both in Chemistry and in Physics, was distinctly high. All the eight candidates showed a fairly wide and accurate acquaintance with their subjects, and most of them had considerable powers of expression.

In Chemistry two of the three candidates reached a really good standard. Special merit was shown in the theoretical work by Mack and De Zilva, while in the practical work also Mack did exceedingly well.

In Physics special merit was shown by Thamotharam in Heat and Light, and by Watson in Electricity and Magnetism. The general average of the work was a little higher than in the Chemistry, and, taking the two papers together, Watson's work was the most uniformly clear and strong. None of the five candidates, however, failed to reach a very fair standard.

II.—A further report (not printed) containing the remarks of the Examiners in Mathematics and Science on the details of the work is being sent with this.

We are, &c.,

E. J. GROSS,
P. E. MATHESON, } Secretaries to the Board.

June, 1902.

No. 4.—THE CAMBRIDGE LOCAL EXAMINATIONS.

The following table shows the number of presentations for the Cambridge Local Examinations since their introduction in 1880 :—

Year.	Total Number of Boys presented. Senior.	Junior.	Total Number of Girls presented. Senior.	Junior.	Total Number. presented.
1880	4	17	—	—	21
1881	14	30	—	5	49
1882	7	43	—	5	55
1883	15	86	—	14	115
1884	23	109	—	5	137
1885	27	159	1	17	204
1886	42	105	3	22	232
1887	32	133	3	21	189
1888	54	124	4	27	209
1889	55	115	3	26	199
1890	40	142	8	33	223
1891	59	156	7	31	253
1892	64	190	9	53	316
1893	58	169	8	42	277
1894	67	179	3	42	301
1895	60	167	7	43	277
1896	57	186	13	43	299
1897	75	195	12	70	352
1898	75	180	12	78	345
1899	84	197	24	81	386
1900	127	210	15	77	429
1901	126	268	28	86	508
1902	174	281	22	87	564

The following is the list in order of merit of the candidates who passed the Cambridge Local Examinations held in December, 1902 :—

SENIOR BOYS.

Order of Merit.	Name.	School.
1.	F. W. Hallock	St. Thomas's College, Colombo
2.	H. S. Perera	St. Thomas's College, Colombo
3.	E. A. Lewis	Ananda College, Colombo
4.	E. F. de Saram	Royal College, Colombo
5.	R. F. P. Jayatilleka	Royal College, Colombo
6.	G. K. W. Perera	Ananda College, Colombo
7.	P. M. A. Corea	St. Benedict's Institute, Colombo
8.	E. H. Beling	Royal College, Colombo
9.	G. Amarasinghe	Richmond College, Galle

MATHEMATICAL PRIZE.

The Mathematical Prize has been won by F. W. Hallock of St. Thomas's College, Colombo.

SCHOLARSHIPS AND EXHIBITIONS.

Junior Boys.

First Exhibition, value Rs. 240 per annum, tenable for three years, has been awarded to M. L. Munesinghe of the Royal College.

Second Exhibition, value Rs. 120 per annum, tenable for three years, has been awarded to P. L. Jansz of the Royal College, Colombo.

Third Exhibition, value Rs. 120 per annum, tenable for three years, has been awarded to L. H. Arndt of St. Thomas's College, Colombo.

Senior Girls.

The Senior Scholarship for Girls, Rs. 240 per annum, tenable for three years, has been awarded to Miss M. M. N. G. N. M. Perera of the Good Shepherd Convent, Kotahena, Colombo.

Junior Girls.

First Exhibition, Rs. 120 per annum, tenable for three years, has been awarded to Miss M. I. de Silva of St. Paul's College, Kandy.

Second Exhibition, Rs. 120 per annum, tenable for three years, has been won by Miss A. G. Weerakoon, Private Study, Colombo.

SENIOR STUDENTS QUALIFYING FOR A PROFESSION AT THE COLOMBO CENTRE.

The candidates named below satisfied the Examiners in the subjects written opposite their names :—

No.			
36	... E. H. Beling	...	Arithmetic, English (Composition, Grammar, and Shakespeare), French, Euclid, Algebra, Trigonometry, and Conic Sections, Applied Mathematics, Theoretical and Practical Chemistry, Electricity and Magnetism.
71	... A. B. Gunasekara	...	Arithmetic, English (Composition, Grammar, and Shakespeare), History and Geography, Latin, Euclid and Algebra, Freehand Drawing.

No.			
82	P. T. LaBrooy	...	Arithmetic, English (Composition, Grammar, and Shakespeare), English History, Latin, Euclid.
94	F. W. Nicholas	...	Arithmetic, English (Composition, Grammar, and Shakespeare), English History and Geography, Latin, French.
148	C. E. Hepponstall	...	Arithmetic, Acts of the Apostles, English (Composition, Grammar, and Shakespeare), English History, Latin, French.

The subjoined tables show the comparative success of the different competing colleges and schools :—

No. 5.—ENGLISH TEACHERS' CERTIFICATE EXAMINATION.

REPORT on the History Papers sent in by Candidates for the English Teachers' Certificates, 1902.

Second Class.—Fourteen papers were sent in by 11 males and 3 females. Average marks obtained :—

By females ...	44·3 per cent.
By males ...	40·5 „

Highest female 50 per cent.; lowest female 40 per cent. Highest male 66 per cent.; lowest male 18 per cent. Only three papers rise up to or exceed 50 per cent., but five more obtain 40 per cent., and four others over 30 per cent. The work shown is very mediocre, but the power of expressing thought in English is fairly satisfactory. There was not one satisfactory answer to question 5, thus showing a lamentable lack of teaching power.

Third Class.—Eighty-five papers sent in : 78 by males and 7 by females.

Average for females ...	53·7 per cent.
Average for males ...	37·3 „

Highest female mark, 80 per cent.; lowest female mark, 40 per cent. Highest male mark, 80 per cent.; lowest male mark, 0 per cent.

Classification of Descending Decades of Percentages.

90 per cent. and under ...	...	...	None.
80 per cent. to 89 per cent. ...	3		
70 per cent. to 79 per cent. ...	2		
60 per cent. to 69 per cent. ...	6	Over 40 per cent. ...	48
50 per cent. to 59 per cent. ...	23		
40 per cent. to 49 per cent. ...	14		
30 per cent. to 39 per cent. ...	8		
20 per cent. to 29 per cent. ...	12		
10 per cent. to 19 per cent. ...	9	Under 40 per cent. ...	37
Under 10 per cent.	8		
			85

The work of the female candidates was well written, clearly expressed, and orderly arranged, and on the whole very creditable.

The extremes among the male candidates were much wider apart.

On the whole, I think there is improvement in the quality of the work sent in, but there is very evident all through a lamentable lack of teaching power. The use of English is very much inferior in this class to that of the candidates for Second Class Certificates.

I append a selection of gems (!) which will prove both this last statement and also the astonishing lack of historical knowledge possessed by many who are even now teaching in our English Schools.

H. HIGHFIELD, M.A.

Historical Gems collected from the Papers of Candidates for the Third Class Certificate.

1. "Llewellyn a Lollard Preacher" (in two papers).
2. "Stephen Langton.....introduced lantern into England."
3. "Parakrama I.: in education he is an ocean.....in short he is a benefactation."
4. "Sir Henry Howard (Ward ?).....he was one of the most important kings ever produced to Ceylon."
5. "By Magna Charta (*a*) the Barons were benefited to do great acts of benevolence by taking the permission of the king."
6. "(*b*) The common people were held as fiefs."

7. Here is an incomprehensible rigmarole: "Children, when we began to study for the examination I thought of the great battle that had undergone such length of time to come into terms are the more faults of the respective parties."

8. "Simon de Montfort was otherwise called as Mortimer; he was the Protector of Somerset."

9. "In the reign of Henry II. Ireland was conquered as far as Wales."

10. "From Magna Charta again we learn that 'Norman should be import from this country without paying a tax.'"

11. "Robert Bruce was the son of a butler; he pretends to be Richard Duke of York."

12. Another says, "Robert Bruce was Priminister *sic*) in the reign of Henry II."

13. "Simon de Montfort was a brave and stout, he has been going into many of the rebellions; anyhow he will put down the rebellion and go."

14. "When Dermot came to Henry II. he went on telling the hole (!) story."

15. "Wiceble" (!) appears in one paper apparently for "advisable."

16. "Anselm, Stephen Langton, Caxton. These were ministers of the Roman Catholic Church. They were all burnt."

17. In place of describing a war with France one candidate says the following about the wars of the Roses:—"Both the parties had to dress different kinds of rose colour suits and had to fight."

The Director of Public Instruction.

SIR,—I HAVE the honour to return the papers of the candidates, Second and Third Classes, for the Teachers' Certificate Examination.

Composition.—Judging by the report of the Examiner in the same subject last year, I should believe that the papers of this year show a certain improvement, and that his remarks have been taken to heart.

Specimens occur of every common error specified in last year's report, but not in a discreditable quantity. The spelling, on the whole, may be regarded as passable; the writing with few exceptions is good.

A small proportion of papers are entirely free from faults of grammar and of idiom.

Much, however, remains to be done. I would recommend that all students, except the best, and especially all Tamils, be discouraged from employing any English terms or expressions which are not the simplest and most direct. In this particular females show more sense than males.

In Composition papers aspiring to the dignity of literature, abbreviations such as *viz.*, *i.e.*, *etc.*, should be discarded.

C. HARTLEY.

English Texts: Third Class.

The Lay of the Last Minstrel.—The papers on the whole show a good knowledge of the poem, though I cannot but wonder at the impudence of some candidates, who apparently present themselves for examination with no knowledge at all. Perhaps the pathetic letter at the end of paper No. 80 excuses others besides the writer! Very few of the candidates attempted the question about metre, and of these few several did not draw the meaning of the terms they used in describing it. I may repeat what the Examiner said last year as to the "paraphrase." As a rule, candidates do not seem to understand what is required. This year the difficulty did not lie in understanding the passage, but in expressing the meaning fully and accurately in correct language. Considering the excellent notes and map in the text-book, it is disappointing to find so much inaccuracy, as when Newark Castle is confused with Branksome Hall, and the widow of the unfortunate Duke of Monmouth with Scott's personal friend, the Countess of Dalkeith.

The Coverly Papers.—The papers generally show an appreciation of the merits of the book and a good knowledge of its subject-matter. The answers to the 9th question were perhaps the most disappointing of all. Almost all the candidates attempted to answer it; the larger number apparently understood the points involved, yet hardly any one succeeded in giving a really clear explanation.

Of the eighty-seven papers submitted to me, eight were really well done, sixteen others obtained more than half marks, and twenty-six more obtained over one-third of the marks.

M. J. BURROWS.

REMARKS on the Papers on School Management at the English Teachers' Certificate Examination, 1902.

THE first thing that impresses one on looking over the papers is the inferior quality of the candidates' handwriting and the slovenly way in which the answers are put down. Having perused these papers, I am not at all surprised to have met with poor handwriting in schools that I have visited, and to have found the written work untidy and unmethodical. The quality of the handwriting of teachers and the style of the work is a matter of such importance that I would recommend immediate steps should be taken for insisting upon better work from candidates for certificates. If necessary, candidates otherwise eligible should be rejected for handwriting alone; but this will hardly be necessary, for it is possible for candidates to improve their handwriting by painstaking practice, and the needed improvement will be accomplished if strict regulations on the subject are issued.

A question in each paper that calls for special comment is the one relating to time tables. I am unable to report that any one time table presented is satisfactory, and the majority were very poor. This is a subject that candidates for certificates should carefully study. No one made an analysis showing the time per week devoted to each subject. Without such an analysis the English Department considers a time table unsatisfactory. No candidate attempted to indicate whether a class was taken in any subject by a pupil teacher, an assistant, or the head teacher. The most noticeable feature of the majority of the time tables was that they disqualified the school, under the provisions of the Code, for receiving grant in aid.

Whilst some of the notes of lessons were fairly satisfactory, many candidates showed that they were not in the habit of using notes of lessons for practical purposes. Many were more of the nature of essays on the subject prescribed for notes, and others would have afforded no assistance in giving a lesson.

Some of the answers to the questions on the teaching of Geography showed that the publication of the address by the Director of Public Instruction had not been without good influence. This fact might be accepted as a hint towards a pleasant way of exerting a beneficial influence on teachers.

Very few of the papers seemed to me deserving more than 50 per cent. of the maximum marks. Many are considerably below that standard. Candidates would do well to study carefully some good text-book or manual on "School Management" or "Method" and to read it in the light of their experience in their own work of teaching. Theory and practice should specially go hand in hand in this subject.

R. B. STRICKLAND.

Third Class.

THE results are on the whole disappointing. Out of 89 candidates one obtained 82 per cent., three 70 per cent., ten between 60 per cent. and 70 per cent., eleven between 50 per cent. and 60 per cent., twenty between 40 per cent. and 50 per cent., nineteen between 30 per cent. and 40 per cent., and the remaining twenty-five less than 30 per cent. It is evident that not a few have taken up this examination without due preparation. More than half of the candidates showed a lamentable ignorance of the subject, while in the case of most of them bad English and also bad spelling helped to emphasize faulty answers. I append a few specimens of answers culled from several papers by no means the worst:—

"Who as a Relative Pronoun is always neuter and it is either Masculine or Feminine."
"The Relative pronoun that is used for men, lower animals and neuter things.
"A Proper noun becomes a Common Noun when it refers to many of that name."
"A Proper is used as a Common Noun when it speaks about a great person or thing personified."
"The vermin comes home."
"Vermin is an obnoxious animal."
"The eaves are a cruel."

D. B. JAYATILLEKE.

Grant-in-aid Teachers' Certificate Examination.

Second Class: English Texts.

FOURTEEN papers on the Merchant of Venice or Johnson's Life of Pope were examined. Five of the fourteen showed creditable work, three of whom were female candidates. The work of the latter pleased me far more than that of the male candidates. They answered to the point, wrote simple and good English, and had evidently prepared with care and thoroughness.

The Shakespeare was as a whole disappointing. Question 2, on the candidates' view of characters of the play, brought out few original points. Candidates should set themselves such questions, or work them out for themselves, afterwards referring to a standard work on Shakespeare's characters, though often this is unhappily a mere counsel of perfection. The questions on Pope were intended in two instances to draw out original comment, but failed to do so. Evidently no candidate had made anything like a close study of even one poem, with the result that such criticism as was given was second-hand or second-rate.

Perhaps such a book as Johnson's Pope is not likely to help a teacher to a good English style, and the Men of Letters' Life, which one candidate quoted, would be better for the purpose, but in any case the Examiner thinks that the setting of one or more of the poems of Pope for special study would have stamped a clearer impression of the writer on the mind.

The male candidates, with three exceptions, wrote poor English, often a bad mixture of inflated Johnsonese and modern slang. A few examples are added below:—

"A fairy gifted him with a gift."
"There are resembles in other plays."
"The great secret of wit is to spot when the joke should be stopped."
"The Rape of the Lock, a very able, sweet and jovial poem."
"Shylock showed a very disinterested (*sic*) and unconcerned regard to his daughter."
"Midas found out his folly by longing to gain the golden touch."

The uses of "who," "he," "it," are treacherous, and much ambiguity was caused by inattention to these.

Mistakes of spelling: the Gesta Romanorum appeared as "Gusta Romanorum," and "Gesa-romanorum."

Il Pecorone was a pitfall: "Il peceroni," "Ilepecorone," "Ill Pecorone" were samples of such errors, which must be avoided by finding out what the Latin or Italian means.

"Sylps," "epithaps," "Pythegoras," "Pythogoras," "Pytogoras," "Phyrgia" show the common mistake about aspirates.

Such a sentence as "The Iliad, the Odyssey, the Homer" show Pope, &c., betrays the worst form of ignorance, and "Pope's Verses on the unfortunately" is an excellent warning to teachers to be careful about pronunciation in class work.

W. A. STONE.

REPORT on Needlework.

Second and Third Class.

THE papers of the Second Class on the whole were fairly done. The candidates seem to have a good knowledge of the subject, but appear to be somewhat wanting in the matter of the method of imparting it. The practical work of this class submitted to us was very bad; except the cutting out, there was hardly any redeeming point.

The majority of the Third Class candidates' papers was passably done; their knowledge of the subject was considerably better than their ability to express it in good English. The practical work of this class was good.

SR. MAY ST. WINIFRED,
Superioress.

REPORT on the Arithmetic Papers, Third Class Teachers' Certificate Examination.

EIGHTY-THREE papers have been examined. A more simple manner of explaining the method of multiplication should have been taken by the majority of the students. Twenty-four did not even attempt it.

Questions 3 and 4 have been the most difficult. Fifty-three attempted question 4, but twenty-seven obtained no marks. Sixty-seven attempted question 3, but twenty obtained no marks. Both questions are easy, but the students have shown a lack of power to analyze the questions. The remainder of the questions have been fairly well done.

THOMAS COCKERILL.

REPORT on the Arithmetic Papers, Second Class Teachers' Certificate Examination.

FOURTEEN papers have been examined. Six of the questions have been done in a satisfactory manner. Questions 5 and 7 have not been understood by many of the students, because they have not been careful in reading the questions. Many found it a difficult matter in question 5 to find the rate of interest after having found the profit.

It is necessary to suggest to the students that better results would be obtained if they gave more attention to the application of the rules of arithmetic to the ordinary commercial results of everyday occurrence.

THOMAS COCKERILL.

REPORT on Geography, Second and Third Class Teachers' Certificate Examination.

CERTAINLY the work done this year is better than last in both classes. More actual knowledge is shown; there is not so much appalling nonsense; there are some decided efforts towards grasping the meaning of the question.

I continue to be struck by the carelessness shown in many, if not most, of the papers: careless writing, slipshod expression, want of method, neglect of neatness. This is very foolish, for an Examiner is justly offended by it, and marks low. One would guess that the large majority of candidates have never had any one to show them how to do a paper, how to arrange and answer, how to impress an Examiner favourably as regards proportion, appearance, moral qualities, as well as mere knowledge. It goes without saying that the weakest point throughout is the power of exhibiting teaching qualities. Hardly a candidate has the foggiest notion how to put a fact before a child. But that perhaps only amounts to saying that hardly a candidate has been trained, which is a truism that perhaps has been sufficiently dwelt upon. But I rejoice to notice several attempts to get upon better lines; to admit the need of globes, blackboards, and practical demonstration; to proceed from the known objects of the neighbourhood to less known objects outside.

All this is hopeful: it does not go so far as to say that there is not far too large a proportion of terribly bad work. That managers may see that there is some justification in our hesitation to admit some of the candidates as permanently qualified teachers of English, I annex a few specimens taken at random. How candidates capable of such atrocities can have been allowed by managers to go up for the examination, or can have been employed as teachers of the English language, opens up a large question.

Judging from the few hopeful signs I have mentioned, I have great hopes that, if our new Geography Manual is out early next year, we may by degrees succeed in raising this unfortunate subject of Geography out of the slough on to firmer and better land. Last year I had no such hopes.

S. M. BURROWS.

3/7. "Important town of Europ are situated on large and important rivers. Because they are used on tarific (and it can be conducted very easily). Nearly all the towns in European countries are productive and for the purpose of carrying trade it does very good."

3/3. "Canterbury contains the St. Paul's Cathedral where the Kings of England are crowned. Lately our King Edward VII. also was crowned there."

3/3. "Singhapore: it is a chief town in Burma. Canterbury is a mountain."

3/6. "Railway is one of the greates advantages to men. By means of which we can reach a place in a short time. By looking at it the mental faculty of the people will be widened."

3/3. "Canterbury. Specially the place is noted for its Bishops: especially Archbishops."

3/4. "As I am village teacher I should always abide by things on land and water. Eel is an acquatic animal, so we have red snake in the land. Eel is unable to live without water, so red snake is unable to live without land. As I am teaching to a village school, we know that there are two parts within our sight, that is land and water. We have greater part of water than land; continents, islands, isthmus, capes are names given to the different parts of land, so we have oceans, seas, lakes, gulfs, straits in water as the land. On following day they were asked to give the description of a mango and at the same time they were asked to draw the shape of that, and then on another day they must be *taught cardinal points*."

Common Errors.

"What you call that place"?
"Make a boy to learn."
"I suppose" for "I hope."

No. 6.—SCHOOL GARDENS.

THE teacher of the Danowita school reports that, as previously notified, they exhibited fruits and vegetables in connection with the gardens of his and neighbouring schools on 22nd March. The Acting Director presided on the occasion. There were 93 prizes, which were gained by the boys of his own school as well as the boys of the Mugurugampola and Kumbaloluwa schools. The schools at Banduragoda, Pasyala, and Dorawaka also sent up exhibits, but gained no prizes. There was a large number of people present on the occasion; sixty-two different kinds of fruits and vegetables were exhibited in 485 lots. The cost of the Show was Rs. 200, of which a sum of Rs. 71·56 was recovered by the sale of vegetables.

The teacher annexes a copy of remarks entered in the Log Book by the Acting Director, and also a list of exhibits and names of the boys who presented them :—

Copy of Remarks referred to.

March 22, 1902.—Visited the school with Mr. Drieberg, Superintendent of School Gardens, and presided at a show of fruits and vegetables in connection with the gardens of this and neighbouring schools. The Mudaliyar of the korale was present, and the teachers of the following schools: Mugurugampola, Kumbaloluwa, Pasyala, Dorawaka, Banduragoda. Prizes were gained by boys of the Mugurugampola and Kumbaloluwa schools, as well as boys of the Danowita school. The show has been well attended. The teacher and all concerned deserve great credit for the way in which it has been carried out.—J. HARWARD, Acting Director of Public Instruction.

No. 7 (1).—SCHOOL TREATS AND PRIZES.

A school treat was held at Rambewa on the 7th October. This had been considered the best way of giving the children of the Province an opportunity of celebrating the Coronation of His Majesty the King Edward VII. Unfortunately, owing to the straggling character of the North-Central Province, it was impossible to choose any place to which all the schools could conveniently come. Rambewa was finally decided upon as being the most central point of the most populated district—that round Anuradhapura itself. Invitations were sent out some weeks before, and were accepted by the teachers of six schools, namely, Mahadiwulwewa, Kahatagasdigiliya, Tammannewa, Ratmalagahawewa, Kendewa, and Kebitigollewa. The Ratemahatmaya of Nuwaragam palata was instructed to make the necessary arrangements, and when I arrived at Rambewa on Sunday the 5th, all was in order to receive the 364 boys who were expected. Two long sheds, substantially built and excellently thatched, had been erected along the two sides of the village green. In the centre was a "stand." for European visitors from Anuradhapura. There was an ample "ring" round this "stand" for sports and races.

The children began to arrive under the charge of their teachers on the evening of Monday, and by 4 A.M. on Tuesday morning about 250 were assembled. By 8 A.M. the last of the 364 had arrived, the total number being exactly what had been expected four weeks before. An excellent open air kitchen had been erected by the Ratemahatmaya, and here early tea was made for the children: cakes, plantains, and tea were served out to them, and they evidently enjoyed it all, the provisions being plentiful and the serving wonderfully expeditious; there was "no waiting."

On the arrival of the Government Agent an inspection was held, and then the schools were led out one by one and drawn up before the "stand," where they were put through their drill by their teachers, and then through their recitation. The drill was very pleasing, and all the schools made a good show, but there was no doubt that the best form was shown by Kendewa and Kahatagasdigiliya. The latter were very well together and smart in all they did, and their exercises were very effective. The children seemed to enter into them with great gusto. The Kendewa boys were equally good in their way, but their numbers were greater, and one could understand that they could scarcely be so smart. What was chiefly striking was the vigour and evident appreciation of the children themselves, and the clear signs in all cases of careful teaching.

By this time there were in the "stand," besides the Government Agent and Mrs. Booth, Mr. and Mrs. Robertson, Mr. MacBride, and Mr. Plant, and the recitation was heard. Each school recited the Coronation ode sent by the Director of Public Instruction. The number of singers varied, however. In the Ratmalagahawewa "choir" there were thirty boys, who sang heartily and knew their piece well, and no doubt their "harmonies" and execution were very good, though an English ear can scarcely judge fairly of Sinhalese "music." Kebitigollewa had a choir of twenty-five, but they were not very well together, though they knew the ode well. Kahatagasdigiliya had only a choir of four. But in all cases the singing went well, was the choir large or small, and all the singers knew their piece and seemed to enjoy singing it. The teachers had evidently taken great pains.

The morning finished with a display of "stick exercise" by some boys of Kebitigollewa. This exercise they did very well, and indeed they were practising it often at odd moments. The children had a mighty Homeric breakfast at 11 A.M. A curry with four dishes besides rice was no doubt as great a delicacy as they could have desired, and a very good and substantial curry had been prepared, including two goats. It was an interesting sight to see the children, neat and tidy, sitting on their mats along the sides of their sheds, with plantain leaves spread in front of them, waiting for their meal. This was also speedily served and speedily eaten, though the children found they could ask for more without being denied.

The afternoon was devoted to sports; unfortunately it began to rain as soon as the "400 yards championship" had been decided. However, the heats of all other events were decided in the commodious sheds, which afforded a course quite 80 yards long, and then, the rain ceasing, the finals came off, and the greasy pole was climbed. The sports included a "400 yards championship" event, a sack race, a Victoria Cross race, and a three-legged race. The system adopted was that of weeding out the champion of each school in heats, and letting the six champions struggle together in the final.

The sports were hugely enjoyed, and then followed the giving of prizes in money and the distribution of Coronation medals by Mrs. Booth. There was one girl among the 364 children, and she received a "gold" medal. The medals were evidently greatly prized, and were handed over by the boys for safety to their relatives, of whom many had come, or to their "Arachchi." Then the children had tea and cake; and preparations were made for their dinner. They were served at 8, and had a great feed, after which, thoroughly tired out, they all slept on their mats watched by their relatives. The Government Agent, going round at 9.30 with the Ratemahatmaya, found all asleep, and all provided with dry mats and clean straw, and generally very comfortable. They set off for their villages, cheerful and healthy-looking, early the next day.

There is no doubt that the whole affair went with a swing, and the children fully appreciated every bit of it. Even the rain could not spoil their enjoyment. This might with advantage be an annual affair, the centre being changed yearly, so that the whole Province might be worked through in a few years.

October 9, 1902. G. F. PLANT.

No. 7 (2).

SIR,—WITH reference to your letter No. 852 A of 28th July, I have the honour to inform you that the prizes offered by Mr. Magdon Ismail, Member of the Municipal Council of Galle, were distributed on the following days :—

At Matara	...	...	...	...	7th August
At Galle...	...	...	...	...	10th August
At Weligama	...	...	...	...	30th August

Prizes were given for general proficiency, needlework, and good attendance. Mr. Ismail supplemented the original amount by a further donation of Rs. 25, as he wished to increase the number of prizes for attendance and needlework.

There was a goodly gathering of the respectable Moorish community at each function. Mr. Ismail attended every prize-giving with his little daughter and took an active part in the proceedings. At Matara the prizes were given away by Mrs. McLeod, and at the other two schools by Miss Ismail. The Chair was taken by the Inspector. Messrs. Blok and Welayden addressed the meeting, the latter giving a succinct account of the history of each school from its inception. Mr. Ismail himself made a forcible appeal to his countrymen to take a more genuine interest in matters educational ; he asked them to follow the example of their co-religionists in India, and called upon them to make strenuous efforts not to be left too far behind, in the race for life, by the other communities of Ceylon.

It is Mr. Ismail's intention to offer next year a prize to every girl who has made more than 100 attendances.

I have, &c.,

H. FERNANDO,
Acting Inspector.

No. 8.

The following tabular returns afford at a glance a summarized comparison of the figures of Government, Grant-in-Aid, and Unaided Schools (including Pansala Schools and Private Schools) since the year 1870 :—

Return of Schools presented for Examination.

* Also a sum of Rs. 550 on account of industrial grants was paid out of votes for 1903.

TRAINING SCHOOLS AND TEACHERS' EXAMINATIONS.

GOVERNMENT TRAINING SCHOOLS.

The following return, giving figures for the last six years, shows the number of Government teachers who are trained or certificated :—

	1897.	1898.	1899.	1900.	1901.	1902.
a Certificated Teachers trained at the old Normal School...	157	136	128	128	128	122
b Teachers not so trained, but who have passed the Teachers' Certificate Examination { Males...	266	267	296	281	305	311
{ Females	97	102	95	118	112	119
(*c*) Uncertificated Teachers	44	52	58	60	63	59
(*d*) Agricultural Instructors and Teachers trained in the new Training Classes	60	59	54	66	65	63
Total ...	624	616	631	653	673	674

GRANT-IN-AID TRAINING SCHOOLS.

A useful work on a small scale is also done by the Grant-in-Aid Vernacular Training Schools. The following table shows the result of their first and second year examinations held in 1902 :—

Training School.	Management.	Number of Scholars who have passed their First Year's Examination and have earned a Grant of Rs. 100 (male) or Rs. 125 (female) each.	Number of Scholars who have passed their Second Year's Examination and have earned a Grant of Rs. 150 (male) or Rs. 175 (female) each.
Kotte boys'	C.M.S.	2	4
Richmond Hill boys'	Wesleyan	2	—
Tellippalai boys'	American	4	5
Uduvil girls'	do.	3	3
Kopay boys'	C.M.S.	1	3

	Total ...	30	22

EXAMINATION FOR CERTIFICATES OF TEACHERS OF GRANT-IN-AID ENGLISH SCHOOLS.

The following table shows the results of the examination for certificates for teachers in Grant-in-Aid English Schools during 1902 :—

		Number presented.	Number passed.			Number presented.	Number passed.
Second Class ...	Males ...	35 ...	26	Third Class ...	Males ...	83 ...	43
Do. ...	Females ...	6 ...	6	Do. ...	Females ...	9 ...	8

EXAMINATION FOR CERTIFICATES OF TEACHERS OF GRANT-IN-AID VERNACULAR SCHOOLS.

The following table shows the results of the examination for certificates for teachers in Grant-in-Aid Vernacular Schools during 1902 :—

		Number Examined.	Number passed.			Number Examined.	Number passed.
Third Class (Tamil) ...	Males ...	13 ...	—	Second Class (Tamil) ...	Males ...	9 ...	2
Do. (Sinhalese) ...	Males ...	144 ...	18	Do. (Sinhalese) ...	Males ...	67 ...	32
	Females ...	24 ...	2		Females ...	2 ...	1

The number of Grant-in-Aid Schools is 1,424, and the rule forbidding payments of grants to schools taught by uncertificated or unlicensed head teachers applies only to Vernacular Boys' and Mixed Schools, of which there are 1,101.

EDUCATIONAL LECTURES.

500 copies printed in 1902. 15 complimentary copies were issued to lecturers and 64 copies sold in 1902.

PUBLICATIONS OF THE DEPARTMENT.

The following books were issued by the Department during the course of the year :—

Title of Books.	Editions printed.	No. of Copies printed.	No. of Thousands already reached.
Sinhalese First Book of Lessons by Mudaliyar Simon de Silva	43rd ...	60,000 ...	327th
Do. 1st Standard Reader by do. ...	30th ...	20,000 ...	149th

Office of Public Instruction,
Colombo, April 29, 1903.

J. HARWARD,
Acting Director.

REGISTRATION.

REPORT OF THE REGISTRAR-GENERAL OF LANDS FOR 1902.

1.—REGISTRATION OF DEEDS.

THE year 1902 shows a slight decrease in registration business compared with 1901, but compares favourably with any previous year, except 1896, when, as I have explained in previous reports, owing to special steps taken by the Department, a large number of deeds that had escaped registration in previous years was registered in addition to current deeds.

2. The number of deeds registered in 1902 was 83,181, involving 135,166 registration entries (each of which represents a separate property). A comparison of these figures with those of previous years gives the following results :—

	Deeds.		Entries.	
	Increase or Decrease.*		Increase or Decrease.*	
	Number.	Percentage.	Number.	Percentage.
1901 ...	—596	—·7	—713	—·5
1900 ...	744	·9	1,128	—·8
1899 ...	4,308	5	6,002	5
1898 ...	6,336	·8	9,163	7
1897 ...	1,200	1	128	·09
1896 ...	5,177	—6	—8,295	—6
1895 ...	12,409	18	20,663	18
1885-94 ...	33,177	66	55,110	·69
1875-84 ...	43,297	109	69,736	107

* The minus mark denotes decrease.

3. The total value of stamp duty levied during the year under the Registration Ordinance (including the duty on applications and copies) was Rs. 223,844, against Rs. 228,011 in 1901 (a fall of 1 per cent.), against Rs. 216,462 in 1900 (a rise of 3 per cent.), against Rs. 221,036 in 1899 (a rise of 1 per cent.), against Rs. 235,323 in 1898 (a fall of 4 per cent.), against Rs. 238,058 in 1897 (a fall of 5 per cent.).

4. Tables III., IV., and V. in the Appendix show in detail the number and description of the deeds registered and the value of the stamps levied in each Land Registry Office in 1902.

5. Of 82,594 deeds affecting immovable property, 40,795, or almost half the number, bore registration stamps of the value of Re. 1, which is the duty on transactions affecting a single land not exceeding Rs. 100 in value; 5,821 bore stamps of Re. 1·25, 1,747 of Re. 1·50, 800 of Re. 1·75, 212 of Rs. 2·25, 65 of Rs. 2·75, 39 of Rs. 3·25, 9 of Rs. 3·75, 4 of Rs. 4·25, 7 of Rs. 4·75, 1 of Rs. 5·25, and 2 of Rs. 6·25; a total of 8,707 representing approximately the number of deeds of the value of Rs. 100 and under, each dealing with more than one land, and therefore charged more than Re. 1.

6. Thus, about 49,502 or 60 per cent. of the total number of deeds represent transactions of the value of Rs. 100 and under, 31,252 or 38 per cent. were of higher value, and 1,840 or 2 per cent. were registered free of duty, being deeds in favour of the Crown, Fiscals' seizures, &c.

7. The average registration duty on a deed was Rs. 2·43 in 1902, against Rs. 2·50 in 1901, Rs. 2·31 in 1900, Rs. 2·46 in 1899, Rs. 2·76 in 1898, Rs. 2·63 in 1897, Rs. 2·56 in 1896, and Rs. 2·33 in 1895.

8. The highest registration duty levied on a single deed was Rs. 1,836. This was on a mortgage bond registered in the Colombo Office securing a sum of Rs. 1,807,058. The two next most valuable deeds were registered in Kandy, yielding Rs. 1,147 and Rs. 610 respectively, and were of the value of Rs. 410,601 and Rs. 601,174, the former affecting 728 allotments of lands and the latter 17.

9. Of deeds yielding a duty of Rs. 100 and upwards, forty-one were registered throughout the Island, viz., nine in Colombo with duty ranging from Rs. 100 to Rs. 316, sixteen in Kandy with duty ranging from Rs. 100 to Rs. 365, three in Kurunegala with duty ranging from Rs. 111 to Rs. 141, three in Kegalla with duty ranging from Rs. 170 to Rs. 218, two in Badulla with duty of Rs. 130 and Rs. 355, two in Galle with duty of Rs. 100 and Rs. 142, two in Chilaw with duty of Rs. 140 and Rs. 342, two in Batticaloa with duty of Rs. 100 and Rs. 120, and two in Negombo with duty of Rs. 100 and Rs. 300.

10. Of 82,594 deeds affecting immovable property, 42,055 or 51 per cent. (against 55 per cent. in 1901) were conveyances by sale and gift, 25,677 or 31 per cent. (against 32 per cent. in 1901) mortgages, 4,130 or 5 per cent. (same percentage as in 1901) leases, and the remainder 10,732 or 13 per cent. (against 870 in 1901) were deeds of other description.

11. The deeds affecting movable property numbered 567, which is ·6 per cent. of the total number of deeds registered, against 656 or ·7 per cent. in 1901. 315 were bills of sale, 145 mortgages, and the remaining 107 were instruments of other description.

12. Twenty powers of attorney were registered under the Ordinance No. 4 of 1902, which came into operation in the latter part of the year, and the stamp duty recovered was Rs. 50.

13. The total value of all the registered transactions was Rs. 53,312,698 in 1902, against Rs. 61,642,521 in 1901, a decrease of Rs. 8,329,823 or 13 per cent., which occurred chiefly in Chilaw, Colombo, Galle, Kandy, and Kurunegala.

14. The value of transfers by sale, gift, &c., and registered in 1902 was Rs. 22,469,097, against Rs. 24,336,897 in 1901, a decrease of about two millions, or 7 per cent.

15. The amount secured by mortgages registered in 1902 (affecting immovable as well as movable property) was Rs. 19,339,425, against Rs. 25,058,969 in 1901, a decrease of about six million rupees, or 23 per cent., on 1901.

16. The value of other deeds registered in 1902 was Rs. 11,504,174, against Rs. 12,246,654, a decrease of Rs. 742,480, or 6 per cent.

17. The average value of a registered deed was Rs. 640 in 1902, against Rs. 735 in 1901, a decrease of Rs. 95.

18. The following Table A shows the progress of registration and the financial condition of this Department since it was established, and includes the number and value of deeds executed in each year :—

Table A.

Progress of Registration and Financial Condition of the Land Registration Department, 1864–1902, with Total Number and Value of Deeds registered and of Deeds executed.

* The minus sign (—) indicates deficit. † Office established in 1888. The average for 1888 to 1894 is shown here.

20. The registration business of the Department, which fell ·7 per cent. in 1902 compared with 1901, shows a rise of about 1 per cent. over 1900 and 4 per cent. over the period 1895 to 1899, and no less than 66 and 108 per cent. respectively over the decades 1885 to 1894 and 1875 to 1884.

21. The slight decrease which has occurred in the business as compared with 1901 occurred in eleven out of the eighteen offices of the Department, and chiefly in Negombo (which shows a fall of 742 deeds or 8 per cent.), Ratnapura (a fall of 399 deeds or 16 per cent.), Kandy (a fall of 331 deeds or 4 per cent.) Kegalla (a fall of 241 or 4 per cent.), Tangalla (a fall of 158 deeds or 8 per cent.), Matara (a fall of 138 or 22 per cent.).

22. Colombo, which registered 16,484 deeds, retains the first place, which it has held since 1885. The next largest number (9,631 deeds) was registered in Kurunegala, which, having overtaken Kandy in 1900, continues to keep the second place.

23. Kandy, which was the premier office till 1885, and yielded the second place to Kurunegala in 1900, and the third place to Negombo the following year, has this year recovered the third place.

24. The position of the other offices remains the same as in 1901.

25. The percentage of deeds registered in the Island in 1902 to deeds executed was 52, a decrease of 1 per cent. compared with 1901 and over the years 1895 to 1899, but a rise of ·4 per cent. on 1900 and 21 per cent. over 1885–1894. The progress in registration since the establishment of the Department in 1864 (when the percentage was 13·2) is shown in the following table :—

Table C.

Deeds executed and registered in the Island, and the Percentage of Registration, 1864 to 1902.

Period.	Deeds executed.	Deeds registered.	Percentage.	Period.	Deeds executed.	Deeds registered.	Percentage.
1864 ...	119,194	15,841	13·2.	1895 ...	159,506	70,772	44·3
1864–88 (yearly average)	147,540	32,138	21·8	1896 ...	147,052	88,358	60·0
1889 ...	149,794	48,686	32·5	1897 ...	149,418	81,981	54·9
1890 ...	148,191	48,154	32·5	1898 ...	140,896	76,845	54·5
1891 ...	152,311	46,725	30·7	1899 ...	140,191	78,873	56·2
1892 ...	169,457	54,072	31·9	1900 ...	158,256	82,437	52·09
1893 ...	171,851	57,941	33·7	1901 ...	156,807	83,777	53·53
1894 ...	168,770	72,447	42·9	1902 ...	158,791	83,181	52·38

26. The rise and fall in registration and the relative proportion in which it was taken advantage of in each office of the Department during the thirty-nine years of its existence are shown in Appendix VIII., and the following Table D is a summary of the figures for 1895 to 1902 :—

Table D.

Relative Proportion of Registered to Executed Deeds in the various Districts, 1875 to 1902.

Office.	Deeds registered in 1902.	Deeds executed in 1902.	Percentage of Deeds registered to Deeds executed.					
			In 1902.	In 1901.	In 1900.	In 1895-99.	In 1885-94.	In 1875-84.
CEYLON	83,181	158,791	52·4	53·05	52·09	53·8	31·06	25·4
Colombo	16,484	30,549	53·9	53·6	52·5	53·9	29·2	24·4

Registrar-General ...	20	—	—	—	—	—	—	—

* Office established in July, 1888. The percentage in 1888-94 is shown here.

27. The small office of Anuradhapura heads the list with a percentage of 82 (against 75 in 1901), ousting Ratnapura, which in 1901 held the first place. The bigger office of Kurunegala comes next to Anuradhapura with a percentage of 70, and is followed closely by Ratnapura and Kegalla with 69 and 68 per cent. respectively; Badulla and Negombo record 63 and 61 per cent. Next in order come Kandy and Chilaw with 58 each, and Kalutara 57, Matara 56, and Colombo with 53 per cent.

28. Thus, eleven out of eighteen offices registered over 50 per cent. of the deeds executed. Ten years ago there were only two offices which reached that percentage.

II.—NOTARIES.

29. The number of notaries practising in the Island at the end of 1902 was 328, an increase of 1 on the number at the end of 1901, 9 on the number for 1900, and 19 on the number for 1899.

30. A list of the notaries practising at the end of 1902 is given in Appendix VII., which shows their respective jurisdictions and places of office and the languages in which they practise.

31. Fifty-six of the notaries practised in English, 148 in Sinhalese, 61 in Tamil, 35 in English and Sinhalese, 22 in English and Tamil, and 6 in Sinhalese and Tamil. They were distributed as follows :—

Western Province.

Total ...			328

* Of this number, 47 practised in the town of Colombo.

32. Twelve notaries died in the year, viz., A. Don Frederick, W. Abeyesinha, H. G. Kelaart, K. D. D. Wickramasinha, J. M. P. W. J. Senawiratna, F. T. Staples, and C. P. G. Wikramaratna of Colombo District, K. D. F. V. Jayatilaka of Kalutara District, I. L. M. Uduma Lebbe Marikar of Matara District, S. Ponnudurai of Jaffna District, and D. J. Abeyaratna and A. Huratalhami of Ratnapura District.

33. The warrants of two notaries, viz., L. N. Prins of Colombo and Ekanayaka Ukku Banda of Matale, were cancelled by the Governor in Executive Council, as the result of inquiries held under section 2 of Ordinance No. 21 of 1900.

34. Similar inquiries held into the conduct of two other notaries, viz., D. A. M. Dissanayaka of Matara District and S. M. P. Wijetilleke of Matale District, resulted in the suspension of their warrants each for three months.

35. Mr. P. Coomaraswamy, a proctor notary of Colombo District, retired from practice in October, 1902.

36. The jurisdictions of six notaries were changed upon their application, viz., D. A. D. S. Wickramasinha was transferred from Matara District to Matale District, U. J. P. Jayasinha from Hambantota District to Colombo District, A. S. Warunakulasingam from Trincomalee District to Batticaloa District, T. H. de Silva from Ratnapura District to Kurunegala District, S. K. Abraham from Valikamam west to Jaffna division of the Jaffna District, and K. Kasippillai from Valikamam east to Valikamam west of the same district.

37. Notary H. J. B. de S. Jayaratna of Colombo District was given extended jurisdiction in his district.

38. During the year seventeen notaries were appointed, viz., D. C. Wijeyesinha, G. H. Philipsey, D. W. S. Samaranayaka, F. N. H. D. Prins, and C. L. Joseph to Colombo District, J. P. S. Jayawardana to Kurunegala District, E. S. F. A. Jayawardana to Chilaw District, D. J. L. J. Panditaratne to Matara District, M. P. M. Christian Perera to Hambantota District, E. D. W. Siebel to Kandy District, G. H. R. Jayamanna to Anuradhapura District, M. V. P. Dharmaratna to Ratnapura District, and S. Veluppillai, T. S. Thuraiappa, A. Cumaraswamy, C. Tilliampalam, and K. Venasittamby to Jaffna District. Of these, Mr. C. L. Joseph was a proctor of the Supreme Court, and G. H. R. Jayamanna was appointed under the proviso to section 7 of the Ordinance No. 2 of 1877.

39. Two examinations of notarial candidates were held by the Council of Legal Education, one in April and the other in October, 1902.

40. At the first examination six candidates presented themselves. Of these, five were articled clerks, and the sixth one was admitted to the examination under the proviso of section 7 of the Ordinance No. 2 of 1877. Four of the former passed the examination, viz., D. C. Wijeyesinha, G. H. Philipsey, E. S. F. A. Jayawardana, and E. D. W. Siebel.

41. At the second examination seven candidates presented themselves, all of whom were articled clerks who had duly served their term of apprenticeship, and six passed, viz., S. Sabapathippillai, S. Kantar, J. V. Ganapathippillai, K. Valoopillai, V. Visuvalingam, and C. S. Chinnatambi.

42. The examination for admission to notarial apprenticeship was held by the Director of Public Instruction in the month of February, 1902. Of sixty-eight candidates admitted to the examination, sixty-three presented themselves, of whom fourteen were successful.

43. Their names and the districts for which they have been licensed are as follows :—

No.	Name of Candidate.	District of intended Practice.	Language of intended Practice.
1.	H. B. Perera ...	Chilaw	Sinhalese
2.	K. S. Perera ...	Kurunegala	do.
3.	H. D. P. Samaranayaka	Colombo	do.
4.	D. M. Minneriya	Chilaw	do.
5.	A. S. Ragunathan	Batticaloa	Tamil
6.	D. P. Jayasuriya	Chilaw	Sinhalese
7.	S. Vaitialingam	Batticaloa	Tamil
8.	G. Subramanian	do.	English and Tamil
9.	F. W. P. Gunawardana	Kandy	English
10.	W. A. D. John Perera	Colombo	do.
11.	R. G. Sabapathy	Batticaloa	Tamil
12.	P. Samaranayake	Matara	Sinhalese
13.	W. A. de Silva	Kandy	English
14.	R. W. Fernando	Colombo	do.

Number, Value, and Description of Deeds Executed.

44. The number and value or consideration of the deeds executed in each district in the English, Sinhalese, and Tamil languages in the years 1889 to 1902, with the value of stamps used in 1894 to 1902 (the information for previous years not being available), are shown in Appendix IX.; and the different descriptions of the deeds executed in the years 1886 to 1902 and the percentage registered are shown in Appendix X.

45. The rise and fall in the number of deeds executed throughout the Island during 1864 to 1902 and in their value during 1889 to 1902 (the value of previous years not having been ascertained) are shown in Table A above.

46. The number of deeds executed throughout the Island in 1902 was 158,788 (exclusive of certain non-notarial deeds, whose exact number cannot be ascertained) of the aggregate value of Rs. 66,259,841. Compared with 1901 this is an increase in number of 2,114 deeds, but a decrease in value of Rs. 7,627,657.

47. The average value of a deed was in 1902 Rs. 417, as against Rs. 407 in 1901.

48. Colombo, as usual, contributed the largest number of deeds, viz., 30,549, or 19 per cent. of the total number for the Island, amounting in value to Rs. 32,340,560, which is 49 per cent. of the total value. The average value of a deed was Rs. 1,058 in 1902, against Rs. 1,290 in 1901.

49. Jaffna shows the next largest number, 22,160, of the value of Rs. 384,081, average value of each being Rs. 288, or about one-fourth of the value of a Colombo deed. Kandy, which follows with 13,728 deeds of the value of Rs. 608,704, shows a higher average, viz., Rs. 443.

50. The other offices where more than 10,000 deeds were executed in 1902 were Galle 14,914 deeds of the value of Rs. 3,141,107, with an average value of Rs. 210 per deed; Kalutara 10,620 of the value of Rs. 2,861,907, with an average value of Rs. 269 per deed; Kurunegala 13,592 deeds of the value of Rs. 2,275,129, with an average value of Rs. 167; Matara 10,837 deeds of the value of Rs. 1,451,982, with an average value of Rs. 134 per deed.

51. The stamps levied on all the deeds executed in the Island in 1902 amounted to Rs. 261,783, against Rs. 265,899 in 1901. Of this amount, the Colombo District yielded Rs. 118,894, which is over half the total for the Island, and over five times the amount levied in Kandy, and four times that in Jaffna, which comes next to Colombo, both in number and value of deeds executed.

52. Of the 158,793 deeds executed throughout the whole Island, 18,077 were in English, 11,196 in Sinhalese, and 29,520 in Tamil.

53. As many as 147,219, or 92 per cent. of the total number (158,793), were executed before notaries, while of the remainder the most numerous class were Crown grants (3,718), Fiscal's transfers (2,752), and discharges (2,723).

54. The number of duplicates examined in 1902 was 153,900, against 181,823 in 1901, and as a result Rs. 542·30 were recovered from notaries on account of deficiency of stamp duty, Rs. 1,022·25 as amount of departmental penalties and of the value of stamps used on affidavits, and Rs. 75 as fine imposed by courts.

III.—REVENUE AND EXPENDITURE.

55. The revenue of the Department in 1902 was Rs. 225,484·30 and the expenditure Rs. 88,768·57, and the nett profit realized was Rs. 136,715·73.

56. The revenue and expenditure of the Department in each year since its creation in 1864 appear in Appendix XII., as also in Table A above.

57. The total nett gain to the Public Exchequer from this Department since its establishment has been Rs. 2,018,296·81.

58. The income, expenditure, and profit of each office in the year 1902 are shown in the following Table E, in which the offices are arranged according to their revenue. The income of each office in each year of the period 1885 to 1902 is given in Appendix XI.:—

Table E.

The Income and Expenditure of each Office of the Land Registration Department during 1902.

Office.	Total Income.		Total Expenditure.		Excess of Income.		Excess of Expenditure.	
	Rs.	c.	Rs.	c.	Rs.	c.	Rs.	c.
Registrar-General	50	0	18,212	6	—		18,162	6
Colombo	51,381	0	14,488	64	36,892	36	—	
Kandy	27,444	50	8,962	75	18,481	75	—

Mannar	495	25	232	0	263	25	—	
Trincomalee	367	50	350	0	17	50	—	
Mullaittivu	39	75	—		39	75	—	
Total ...	225,484	30	88,768	57	154,877	79	18,162	6
Deduct excess of Expenditure ...					18,162	6		
Nett excess of Income ...					136,715	73		

59. It will be seen that every office shows a profit. Colombo and Kandy, as usual, occupy the first and second places, with incomes of Rs. 51,381 and Rs. 27,444 and profits of Rs. 36,892 and Rs. 18,481 respectively. Kurunegala, which shows an income of Rs. 20,495 and a profit of Rs. 14,943, has regained the third place, which it yielded to Negombo in 1899. Negombo follows with an income of Rs. 17,866 and profit of Rs. 13,756, Jaffna with an income of Rs. 17,442 and a profit of Rs. 13,688, Galle with an income of Rs. 16,978 and profit of Rs. 9,956, and the other offices retain their respective places they occupied in 1901.

60. The largest profit next to Colombo and Kandy was in Kurunegala (Rs. 14,943), followed by Negombo (Rs. 13,756), Jaffna (Rs. 13,688), and Chilaw (Rs. 11,231).

Administration.

61. The duties in connection with the Decennial Census, of which I had been in charge since 1900, terminated in December last. Census duties rather seriously interfered with my inspection of outstation offices.

62. The following are among the changes in the staff during the year:—

Mr. S. D. Ekanaike was appointed Registrar of Lands, Kalutara, in place of Mr. H. R. Abeywardene, who was transferred as Head Clerk of the Kandy Land Registry.

The Registrarship of Negombo rendered vacant by the retirement of Mr. L. D. Silva in December, 1901, was conferred on Mr. K. D. Perera of the Kurunegala Kachcheri.

The Matara Registrarship, an appointment of the Second Class, in which a Third Class officer had been acting since November, 1901, was permanently filled by the appointment of Mr. F. W. M. Karunaratne, an officer of the Second Class. He was previously employed in the District Court, Kandy, and was transferred on an exchange of duties with Mr. B. P. de S. Samarasinhe, an officer of the Births, Marriages, and Deaths Branch.

Mr. D. L. Perera of the Fiscal's Office, Colombo, was appointed Registrar of Lands, Kegalla, in succession to Mr. J. F. Perera, who was transferred to the Secretariat.

Mr. E. Weinman, Secretary of the District Court, Trincomalee, was appointed Registrar of Lands, Trincomalee, *vice* Mr. V. E. Parys.

Mr. P. C. Fernando, who was seconded for duty in the Audit Office in place of Mr. G. Arumuham, reverted to his post as Financial Clerk of this Department.

Mr. A. W. Wijesinhe was transferred to the Panadure Police Court from the Kalutara Land Registry, and Mr. F. E. Punchihewa from the Badulla Land Registry to the District Court, Badulla.

Messrs. Van Felse and D. T. F. Obeyesekere, Clerks of the Galle Land Registry, retired during the year.

63. The Ratnapura Registrarship, an appointment of the Second Class, continues to be filled by an officer of the Third Class for want of an officer of the higher class. Another post of the Second Class, viz., the Second Clerkship of my Head Office, is filled by a Third Class Officer.

64. His Excellency the Governor was pleased to sanction the addition of the following posts of this Department to the schedule of offices which entitled the incumbents, if Sinhalese or Tamil, to official rank to be held *ex-officio*:—

To be Mudaliyars: The Registrars of Lands, Kandy, Galle, Kurunegala, Kalutara, Matara, Negombo, Badulla, Jaffna, Ratnapura, and the Chief Clerk of the Registrar-General's Office, who is also Additional Registrar of Lands.

To be Muhandirams: The Registrars of Lands, Kegalla, Tangalla, Chilaw, Batticaloa, and the Head Clerk, Kandy.

Office Accommodation.

65. The want of sufficient accommodation at my Head Office, which was admitted by Government several years ago, has not yet been supplied. It is now more than five years since the Department was promised the addition of the upper floor now occupied by the Public Works Office, for which it was decided to construct a new building, but it has not been commenced yet. Every part of the present office is so crowded that business is transacted with great inconvenience to the public as well as to the officers; and the present state of things cannot continue much longer without serious impediment to public business and detriment to the records. It is hoped that this long-standing grievance will soon be remedied.

66. The Anuradhapura Land Registry has been provided with satisfactory accommodation in the new court-house building.

67. For the Chilaw Office better accommodation is urgently needed. The construction of a new building, for which an estimate of Rs. 19,050 was sanctioned by Government in January, 1902, has been postponed, the site selected having been found to be insufficient; and further provision has to be made for acquisition of another site. Meantime it is proposed to give the registrar some relief by adding to his present office two adjoining rooms recently vacated by the Police Court.

68. The need of better accommodation for the Matara Office, alluded to in my previous report, continues. The Assistant Government Agent, with whom I have been in communication on the subject, will I hope include the necessary provision in any scheme he may submit to Government for improved accommodation for offices in his own charge.

69. At Ratnapura business is conducted under great difficulties for want of proper accommodation, not to mention the consequent exposure of records to damage. In May last His Excellency the Lieutenant-Governor, who visited the Land Registry Office, was satisfied as to the inadequacy of the accommodation. The Government Agent has, I understand, included provision for it in a scheme submitted by him to Government.

70. The Batticaloa Office is also in need of additional accommodation.

Consolidation of Indexes.

71. Considerable progress was made in this branch of work during 1902, as will appear from Table XV. in the Appendix.

72. The indexes of three divisions, viz., Badulla B, Kandy C, and Jaffna A, which had been sent to the Printer in the latter part of 1901, were completed.

73. In Colombo the compilation of the indexes of two important divisions, C and M, was completed. They were sent to the Printer about the end of the year, and are expected to be printed in about two months.

74. The indexes of seven divisions are now ready for the press, viz., Colombo B, Jaffna E, Kalutara A, Kandy D, Kegalla A, Matara A, and Negombo B. Those of Galle C division, Batticaloa B, and Ratnapura C will be ready for the press in the course of next month.

75. The following indexes were commenced during the year, viz., Jaffna C and D, Kandy E, Kegalla E, and Matara D.

Records.

76. During the year there were 329,787 records verified, listed, and filed, of which 184,330 were duplicates of notarial and other documents (including 16,420 Crown grants), and 132,576 were protocols of notaries who have ceased to practise. The remaining 12,881 were chiefly monthly lists furnished by notaries to the Registrar-General.

77. The fees recovered for copies and searches amounted to Rs. 20,948 against Rs. 20,326 in 1901, and the expenditure Rs. 27,633 against Rs. 23,005 in 1901. There was an unusually large expenditure during the last two years owing to the employment of additional hands and other arrangements that were necessary to expedite the compilation and printing of the consolidated indexes that had been undertaken.

Supervision of Notaries.

78. The amendments made in the law regarding the duties and supervision of notaries by the Ordinance No. 21 of 1900 have been found to work very well, and there is a distinct improvement in the work of these officers.

79. With a view to the prevention of frauds by false personation and of the employment by some notaries of "professional witnesses" who hang about notaries' offices, especially in the Matara District, and offer their services for a small consideration, the following rule was passed in June, 1902, by His Excellency the Governor, with the advice of the Executive Council, under section 4 of the Ordinance No. 21 of 1900, for the guidance of notaries not being advocates or proctors:—

"When a person executing a deed is not known to the notary, but to the attesting witnesses, the notary must satisfy himself before accepting them as witnesses that the witnesses are well acquainted with the executant and know his proper name, occupation, and residence."

80. During the year twenty-eight notaries' offices were inspected by the Government Agents and Assistant Government Agents in pursuance of the powers vested in them by the provision in rule 3 of sub-section 36 of section 3 of the Ordinance No. 21 of 1900. This provision in the Ordinance is very salutary in making the notaries very careful in their work, thereby safeguarding the interests of the public.

81. Several cases were instituted against notaries and others in connection with irregularities and frauds that were discovered. The more important of them are mentioned below.

82. Notary D. J. Kulutara, who was prosecuted in P. C., Colombo, case No. 76,752, for habitual delay in furnishing duplicates of deeds attested by him, was convicted and fined Rs. 75.

83. Notary G. E. D. Seneviratna of Matara District was prosecuted in P. C., Matara, case No. 9,082, for failing to state in the attestation of the duplicate the alterations, erasures, and interpolations appearing in that document. The case on being committed to the District Court was dismissed and the notary acquitted, the District Judge holding that the word "deed" in sub-section 22 of section 3 of Ordinance No. 21 of 1900 means only the original and does not apply to the duplicate. But in appeal the District Judge's decision was set aside, and the notary convicted and fined by the Acting Chief Justice.*

84. Notary J. de Z. Siriwardana of Galle District was suspended in August, pending trial before the Supreme Court for forgery. He was tried at Colombo in December last and was acquitted.

85. Last will No. 3,373, dated 27th November, 1896, attested by the same notary, was held to be a forgery in D. C., Galle, testamentary case No. 3,385, and this decision has been upheld by the Supreme Court in appeal.

86. In D. C., Galle, case No. 5,829, a deed of gift purporting to have been executed by one Engaltina Dias Abeyesingha, and to have been attested by the deceased notary W. G. E. de S. Rajakaruna of Galle District under No. 20,119 of 15th October, 1893, was held to be a forgery. The case has gone in appeal.

87. Last will No. 7,370 of 20th December, 1870, purporting to have been attested by the same notary was pronounced a forgery in D. C., Galle, testamentary case No. 3,353, and this decision has been upheld in appeal. Criminal proceedings were instituted against the party who uttered the will and the two witnesses. The former was tried in the District Court and sentenced to two years' rigorous imprisonment. The accused has appealed. The two witnesses are in concealment and have been proclaimed.

88. Deed of transfer No. 13,732 of 12th September, 1901, alleged to have been attested by notary D. L. D. S. Wickramanayaka of Galle, was found to be a forgery. The woman who executed the deed and the transferee (also a woman) were tried before the Supreme Court and found guilty by an unanimous verdict. The jury, however, recommended them for mercy, as they considered they were merely dupes in the hands of the second accused's husband, who is in concealment. The accused were accordingly discharged.

Registration of Titles to Land.

89. This subject has made no progress since the date of my last report. A Sessional Paper is about to be published containing the report of the Committee presided over by the Attorney-General (now Chief Justice) Hon. Mr. C. P. Layard, together with the Draft Ordinance submitted by the Committee to Government. It is hoped that at no distant date the Bill will become law, and the public begin to enjoy the benefits so long deferred of a complete system of registration.

Registrar-General's Office,
Colombo, March 14, 1903.

P. ARUNACHALAM,
Registrar-General.

APPENDIX.

I.—The Business, Revenue, and Expenditure of the Land Registration Department in 1901 and 1902.

* In these years the income other than registration duty (such as deficiency of duty and fines recovered from notaries upon deeds attested by them, and which average about Rs: 1,600 a year for the whole Department) is not included, not being ascertainable separately.

† Income for half-year. Office established in July, 1888.

VITAL STATISTICS.

REPORT OF THE REGISTRAR-GENERAL OF CEYLON FOR 1902.

I.—POPULATION.

THE population of Ceylon, as enumerated at the Census of 1st March, 1901, was 3,565,954 persons, exclusive of the military and shipping population and the South African prisoners of war, and was distributed over 28 towns, 12,870 villages, 598,076 occupied houses, and 664,371 families, giving a density of 141 persons and 23·6 houses per square mile, 5·2 persons per house, and 4·7 persons per family.* The estimated increase from the date of the Census to the end of December, 1902, amounted to 106,934, being the excess of births over deaths registered, plus the excess of arrivals over departures of Indian coolies. This number being added, the estimated population on 31st December, 1902, would be 3,672,888. The rates for each year of the decade ending 31st December, 1900, have been re-calculated according to the results of the Census.

2. *Indian Immigration.*—The total number of Indian coolies who arrived in 1902 was 87,763, as against 63,917 departures.

Table A shows the arrivals and departures of Indian coolies in the period 1871–1902. The largest number of arrivals recorded in any year previous to 1900 was in 1876 and 1877, when the Indian famine drove a large number of coolies to Ceylon, causing an excess of arrivals of over 70,000. The tide of immigration was arrested in 1879 in sympathy with the general depression that followed the downfall of the coffee enterprise. In the years 1879–1886 the usual excess of arrivals over departures was turned into a deficit.

3. In 1887 the return of better times, consequent on the increase of tea cultivation, was accompanied by an excess of arrivals, which reached its highest point in 1892 (48,856), and fluctuated in subsequent years till it became a deficit of 13,236 in 1899, a deficit attributed to good harvests in Southern India and to the closing of the Northern immigration route. In 1900 there was a sudden and striking rebound, showing, in spite of so many as 113,000 departures, the unprecedented excess of 95,000 arrivals. In the following year the departures increased slightly, and the arrivals diminished by about a half, and the excess of arrivals over departures was only 2,260. In the year under report both arrivals and departures fell considerably. The immigrants numbered 87,763 (the lowest level reached in the decade 1893–1902, excluding 1894 and 1899), and the emigrants numbered 63,917 (the lowest number in the decade), leaving an excess of 23,846 immigrants over emigrants.

Table A.—Arrivals and Departures of Indian Coolies, 1871–1902.

Year.	Arrivals.	Departures.	Excess or Deficit.	Year.	Arrivals.	Departures.	Excess or Deficit.
1871	88,529	58,610	29,919	1888	82,587	55,805	26,782

1884	45,777	50,085	—4,308	1901	120,603	118,343	2,260
1885	47,794	48,863	—1,069	1902	87,763	63,917	23,846
1886	39,907	45,250	—5,343				
1887	72,660	55,121	17,539	Total	3,026,883	2,385,060	641,823

4. *Population and Registration in 1871–1902.*—Tables I. and II. in the Appendix show the population estimated in the middle of each year from 1867 (when the registration laws first came into operation in the Island), the number of births, marriages, and deaths registered in each year, and their proportion to 1,000 persons living, and the difference between registered births and deaths and between immigrants and emigrants.

5. The population increased in the thirty-two years 1871–1902 from 2,417,000 to 3,630,000 in round numbers; that is, by 1,213,000 or over 50 per cent. About half of this increase was due to immigration. The annual growth of the population in the period 1871–1881 was 13·2 per 1,000, 8 per 1,000 in 1881–1891, and 17·3 per 1,000 in 1891–1901. In 1902 the rate of increase was 18·3, at which rate the population should double itself in thirty-eight years.

* For detailed results of the Census and a review thereof reference is requested to my Report on the Census of Ceylon, 1901. A special chapter (XXIV. of vol. I.) is added on the Vital Statistics of the two decades 1881–1890 and 1891–1900, with a health map of the Island; also a Life Table (chapter XXII.).

6. *Race Distribution.*—Table III. shows the estimated population of each race in the Island, the number of persons of each race registered as married, born, or dead, with their rates per 1,000 persons living, in the years 1901 and 1902, as well as the averages for the period 1892–1901. Tables IV. and V. give the number of births, marriages, and deaths registered in that period, with their rates for each province and district.

7. The numbers of the various races and the proportion of each to a thousand of the total populationat the Census of 1901 and in the middle of 1902 are shown in the following table:—

Table B.—Race Distribution of the Population (exclusive of the Military, the Shipping, and the Prisoners of War).

Race.	At the Census of 1901.	At the Middle of 1902.	Proportion to 1,000. At the Census of 1901.	At the Middle of 1902.
Europeans ...	6,300	6,336	1·8	1·7
Burghers ...	23,482	23,732	6·6	6·5
Sinhalese ...	2,330,807	2,381,013	653·7	656·0
Tamils ...	951,740	963,372	266·9	265·4
Moors ...	228,034	230,150	63·9	63·4
Malays ...	11,902	11,939	3·3	3·3
Others ...	13,689	13,444	3·8	3·7

8. It will be seen that since the Census of 1901 the proportion of the various sections of the population has decreased, except in the case of the Sinhalese, who show an increase of 2·3 per 1,000, and of the Malays, who show the same proportion as at the Census.

II.—MARRIAGES.

9. The marriages registered in 1902 numbered 27,816, of which 21,364 were "general" (*i.e.*, other than Kandyan or Mohammedan) marriages and 6,452 Kandyan marriages. The marriage rate (*i.e.*, the proportion of persons whose marriages were registered in 1902 to 1,000 persons living) is 16·4, which is higher than the rate for the preceding year and the mean rate for the decade 1892–1901 by 2·2 and 1·1 per 1,000 respectively. The increase in the number of marriages registered in 1902, as compared with the years 1900 and 1901, was chiefly due to the registration in the Matara District of an abnormally large number of unions which the parties had previously contracted according to customary ceremonies, but had failed to register until special efforts were made by the Assistant Provincial Registrar, Matara, to secure their registration.

10. The proportion of the number of persons (other than Mohammedans) whose marriages were registered to 1,000 persons living is given in the following Table C for the years 1901 and 1902, with the average for the decade 1892–1901. The figures are based solely on the registered marriages, and take no account of the marriages legally contracted among non-Kandyan Sinhalese Buddhists and among Hindus according to customary and religious rites, but not registered. This accounts for the low rate among the Tamils, who are mostly Hindus.

Table C.—Marriage Rates among the different Races, 1902, 1901, and 1892–1901.

	1902.	1901.	1892–1901.
All races (excluding Mohammedans) ...	16·4	14·2	15·3
Europeans	23·9	19·7	24·1
Burghers	17·1	14·5	15·2
Sinhalese	20·6	17·2	18·7
Tamils	6·2	7·0	7·0
Others	1·9	1·6	1·4

11. Table D below shows the Kandyan marriages, general marriages, their total, and the proportion of the number of persons married to 1,000 persons living in each of the years 1871–1902.

12. The Kandyans are, as a rule, indifferent to registration, though the law makes the issue of their unregistered unions bastards. The number of marriages registered among them varies with the pressure applied to them by the Government Agents, who, under instructions from Government, made special efforts in 1894, 1895, 1899, and 1900, and secured the registration of the marriages of a large number of couples who had been living together as husband and wife according to Kandyan custom. Thus, as many as 16,801 Kandyan marriages were registered in 1895, and nearly 16,000 in 1899. Since that year apparently the pressure has been relaxed, and there has been a continuous decline in the number of Kandyan marriages, till in the year under report the number of Kandyan marriages registered was as low as 6,452, a marked contrast to the "general marriages," which have increased from 16,535 in 1899 to 21,364 in 1902.

Table D.—Kandyan and General Marriages, their Total, and the Rates of the Number of Persons married to 1,000 Persons living, 1871–1902.

Year.	Kandyan Marriages.	General Marriages.	Total.	Rate per 1,000.	Year.	Kandyan Marriages.	General Marriages.	Total.	Rate per 1,000.

13. *Mohammedan Marriages.*—The Ordinances Nos. 8 of 1886 and 2 of 1888 requiring the registration of Mohammedan marriages were in 1900 in force in the Western, Central, Southern, North-Western, North-Central, Uva, and Sabaragamuwa Provinces, and in the Batticaloa District of the Eastern Province. In August, 1901, the Northern Province, including the Districts of Jaffna, Mannar, and Mullaittivu, was also brought under the operation of the Mohammedan Marriage Registration Ordinances. It will be seen from the following Table E that, except in the Puttalam and Galle Districts, and this year also in the Jaffna and the Mullaittivu Districts, the Mohammedans have availed themselves but little of the opportunity of registering their marriages. In the Districts of Puttalam and Galle the rates of persons married to 1,000 persons living per annum were 21·7 and 19·3 respectively. In the Jaffna District, which has little more than 3,000 Mohammedans, the rate was as high as 27·0, a remarkable increase on the previous year (4·4). But Batticaloa, the chief Mohammedan district in the Island, shows only 1·7 per 1,000, and Colombo 5·5 :—

Table E.—Mohammedan Marriages in 1892–1901, 1901, and 1902.

Province and District.	Mohammedan Population at the Census of 1901.	Number of Marriages.			Persons married to 1,000 living.

14. *First Marriages; Re-Marriages.*—Of each 1,000 men married in the general community, 906 were bachelors and 94 widowers; of each 1,000 women married, 953 were spinsters and 47 widows. Among the Kandyans, of each 1,000 men married, 850 were bachelors and 150 widowers; of each 1,000 women married, 911 were spinsters and 89 widows.

15. In the general community, of the 19,347 bachelors who married during the year, 18,626 or 96 per cent. married spinsters and 721 or 4 per cent. married widows; of the 2,017 widowers who re-married, 1,735 or 86 per cent. married spinsters and 282 or 14 per cent. married widows; of the 20,361 spinsters who married during the year, 18,626 or 91 per cent. married bachelors and 1,734 or 9 per cent. married widowers; of the widows who re-married, 721 or 72 per cent. married bachelors and 282 or 28 per cent. married widowers (Table VIII. in Appendix).

16. Among the Kandyans, of the 5,487 bachelors who married during the year, 5,164 or 94 per cent. married spinsters and 323 or 6 per cent. married widows; of the 965 widowers who re-married, 714 or 74 per cent. married spinsters and 251 or 26 per cent. married widows; of the 5,878 spinsters who married, 5,164 or 88 per cent. married bachelors and 714 or 12 per cent. married widowers; of the 574 widows who re-married, 323 or 56 per cent. married bachelors and 251 or 44 per cent. married widowers (Table IX.). For the purposes of the calculation in this and the two preceding paragraphs, 212 divorced men and 223 divorced women have been treated as bachelors and spinsters respectively.

17. *Divorces.*—Divorces among the general community are granted by the District Courts; among the Kandyans by the Government Agents and their Assistants. There were 536 divorces among the Kandyans this year (Table XIII.), making the proportion to the marriages in the year 8·3 per cent., a rate nearly seventy times as large as in the general community (·12 per cent.), the total number of divorces pronounced in the several District Courts of the Island in 1902 being 27, against 21,364 general marriages registered in the year.

It would thus appear that the Kandyans are more anxious to escape from the bonds of matrimony than other sections of our population, except the Mohammedans, of whose divorces we have no statistics. This may perhaps be explained by the greater facilities afforded by the Kandyan Marriage Ordinance than by the General Marriage Ordinance for obtaining divorces. Divorces among the Kandyans are obtainable, among other reasons, by mutual consent, or on the ground of inability to live happily together, and need leave no stain on the character of the divorced women.

18. *Re-marriages of divorced Persons.*—Among the general community 20 divorced men and 11 divorced women re-married in the year; among the Kandyans 192 divorced men and 212 divorced women, against 250 divorced men and 214 divorced women in 1901.

19. *Minors.*—The number of males under 21 years of age who married in the year 1902 was 707 among the general community and 841 among the Kandyans, and the number of females under that age was 8,224 in the general community and 4,188 among the Kandyans.

The number of mixed marriages registered was as follows (see also Table XI. in the Appendix):—

	1902.	1901.	Mean in the Period of 1892–1901.
Between Europeans and Burghers	10	10	11·6
Between Europeans and Sinhalese	2	4	2·6
Between Europeans and Tamils	—	—	·5
Between Burghers and Sinhalese	31	22	27·4
Between Burghers and Tamils	3	6	5·3
Between Sinhalese and Tamils	85	69	56·1
Other Mixed Marriages	8	10	5·5

20. *Signature in the Marriage Register.*—Of the men in the general community who married in the year 1902, 32 per cent. (as against 25 per cent. in 1901) and of the women 79 per cent. (as against 75 per cent. in 1901) were unable to sign their names in the register with letters (Table VIII.); and among the Kandyans, who usually show a higher proportion of illiterates, 37 per cent. of the men (as against 38 per cent. in 1901) and 96 per cent. of the women (as against 97 per cent. in 1901) were unable to sign their names (Table IX.).

21. *Age at Marriage.*—Among the general community this year the mean male age at marriage was 30·9, as against 27·3 in the preceding year and in 1900; for females 23·9, as against 20·9 last year and 21·0 in 1900. Among the Kandyans the mean age at marriage for males was 27·5 (as against 27·7 last year) and for females 20·7 (as against 21·5 last year). The mean ages for the general community have been exaggerated by the large number of marriages registered in Matara District (see paragraph 9).

The highest age at marriage in 1902 was, in the general community, for males 100 years, for females 84 years, and among the Kandyans for males 80 years and for females 65 years. The lowest age at marriage, both in the general community and among Kandyans, was 16 for males and 12 for females.

The mean and maximum ages are probably misleading, for in many cases the parties would appear to have contracted marriages according to their religious customs, and lived together as husband and wife for years before registering their marriage.

22. *Buildings registered for the Solemnization of Marriages* (Table XII.).—The number of buildings registered for the solemnization of Christian marriages, and registration of which had not been cancelled at the end of 1902, was 765, of which 481 were Roman Catholic, 112 Church of England, 78 Wesleyan, 20 Salvation Army, 19 Baptist, 19 Congregationalist, 19 Independent Catholic, 8 Dutch Presbyterian, 6 Portuguese Roman Catholic, 2 Scotch Presbyterian, and 1 registered by the Society of Friends.

III.—BIRTHS.

23. The births registered during the year 1902 numbered 141,893, and were equal to a rate of 38·5 per 1,000 persons living. This rate is slightly higher than the rate for the preceding year (37·5) and the average for the years 1897–1901 (38·2), the period of improved registration of births. Compared with the earlier half of the last decade, however, the rate for the year under report shows an increase of 6·8 per 1,000.

24. The number of births registered and the rates in each of the years 1867–1902 are shown in Tables I. and II. in the Appendix. The number of births and their rates are shown for each of the years 1902 and 1901, with the average rate for the decade 1892–1901, in Table III. according to races; in Tables IV. and V. according to Provinces and districts; Tables VI. and VII. (*a*) and (*b*) show separately the Sinhalese, Tamil, and Moor births and deaths for 1902 and 1901, and their rates for the various subdivisions of the Island in 1892–1901 and 1902.

25. The registration of births in the early years of civil registration was very imperfect, and improved gradually after 1887, when under a provision in the Penal Code prosecutions began to be entered against those who neglected the registration of births, and other steps taken to ensure registration. The improvement has become marked since 1897, in July of which year the Ordinance No. 1 of 1895 came into operation.

26. The subjoined Table F, in which birth-rates in the several districts for 1902 are arranged in descending order, shows also the amount of increase or decrease in 1902, compared with the averages in the periods 1897–1901 and 1892–1896:—

Table F.—Comparative Statement of the Mean Annual Birth-rates in the Periods of 1892–1896 and 1897–1901 and 1902

District.	1902.	1897–1901.	1892–1896.	Increase of 1902 compared with 1897–1901.	Increase of 1902 compared with 1892–1896.	Increase of 1897–1901 compared with 1892–1896.

Nuwara Eliya ...	28·9	26·6	29·1	2·3	—·2	—2·5

27. While only one of the twenty-one districts, viz., Nuwara Eliya, shows a decrease in the birth-rate for 1902 as compared with the average for the period 1892–1896, six districts (viz., Anuradhapura, Puttalam, Mullaittivu, Ratnapura, Trincomalee, and Jaffna) show a decrease as compared with the average for the period 1897–1901, the remaining fifteen districts showing an increase ranging between ·4 per 1,000 in Kurunegala and 4·8 in Hambantota. Batticaloa District, as usual, ranks first in regard to its birth-rate (45·9), followed by Matara (45·1), Hambantota (44·8), Kurunegala (44·1), Matale (43·5), Galle (43·5), Badulla (42·6), Kegalla (41·8), Negombo (41·3), and Ratnapura (40·8). All the districts, except the last-named, the birth-rate of which in the year shows a decline of 1·9 per 1,000, show higher rates compared with their averages. The lowest birth-rate was, as usual, in the Nuwara Eliya District (28·9), which, however, shows a rise of 2·3 per 1,000, compared with the average (26·6). This is, besides, the only district the mean birth-rate of which for the five years 1897–1901 (26·6) is lower than that for the preceding five years 1892–1896 (29·1). The births and their rates for the years 1901 and 1902 and the average for 1892–1901 among the different races of the Island appear in Table III., and their rates are compared in Table G below, from which it will be seen that all the races show improved birth-rates, as compared with 1901 as well as the average for the ten years 1892–1901.

28. *Sex.*—Of the 141,893 births registered in the year, the births of males numbered 72,928 and the births of females 68,965, the former being to the latter in the proportion of 1,057 to 1,000 (Tables XIV. and XV.).

29. *Legitimacy.*—I have since 1898 omitted as misleading the information which used to be given as to legitimate and illegitimate births. Except among the Kandyan Sinhalese, registration is not essential to the validity of a marriage, and a large number of the people are content with the customary or religious ceremonies of marriage and do not register it. So strong, however, is the public sentiment in favour of matrimony that almost every marriageable girl is married, and to secure this parents, brothers, and other male relations often make great sacrifices.

30. There was a doubt as to the validity in law of a marriage contracted without registration, but it has been dispelled by decisions of the Supreme Court and the Privy Council. Even if it had been otherwise, it is rather a misnomer to designate as illegitimate the issue of such unions. Even the Kandyan Sinhalese, in spite of the Ordinance No. 3 of 1870, continue, as I have said before, to ignore the registration of marriages (except when pressed by the Government Agents) and to procreate children whom the law deems bastards, but who are according to public sentiment legitimate.

31. There is, on the whole, in Ceylon comparatively little of what would be considered illegitimacy in Europe, the fruit of immorality on the part of parents, and what illegitimacy exists is mainly in towns where a foreign population has called into existence a class of immoral women, both natives and foreigners.

IV.—DEATHS.

32. The deaths registered in 1902 numbered 99,680, and were in the proportion of 27·5 to 1,000 persons living, as against 98,813 deaths and a rate of 27·6 in the previous year.

33. The number of deaths registered and the rates in each of the years 1867–1902 are given in Tables I. and II. in the Appendix. Till within the last fifteen years registration of deaths was not performed with much care, and the figures, especially for the earlier years, probably under-state the mortality. The death-rate rose from 19·4 in 1871 to 31·7 in 1877, a year distinguished by a severe epidemic of cholera and by a large mortality among the Indian immigrants, who were driven by famine to Ceylon. The death-rate fell (as happens not unusually after a period of high mortality) to about 20 per 1,000 and below in 1879 and 1880, rising in 1885 to 29·1 and in 1893 to 29·6, a rate which, except in 1899, has not since been exceeded. The mortality steadily declined from 1893 till

it reached 23·7 in 1897, from which it rose to 26·6 in 1898 and 30·6 in 1899. In 1900 the rate fell to 28·7, in 1901 to 27·6, and this year to 27·5. This reduction, in spite of improved registration, is an indication of improved health.

34. *Race.*—The number of deaths and their rates for each of the years 1901 and 1902, and the average for the decade 1892–1901 are given for the various races in Table III. in the Appendix. The rates for 1901 and 1902 and the average rate for the years 1892–1901 are compared below :—

Table G.—Birth- and Death-rates among the different Races.

Nationalities.	Birth-rate.			Death-rate.		
	Average. 1892–1901.	1901.	1902.	Average. 1892–1902.	1901.	1902
All races	35·0	37·5	38·5	27·5	27·6	27·5
Europeans	28·6	24·4	29·7	22·0	23·6	20·2
Burghers	21·9	29·0	29·8	19·9	21·1	21·3
Sinhalese	37·5	41·1	43·2	26·6	25·3	26·1
Tamils	28·3	29·4	29·9	29·1	32·9	30·5
Moors	37·3	36·9	38·6	30·2	29·6	29·6
Malays	23·6	29·8	30·3	35·3	27·6	26·0
Others	9·4	12·4	13·9	15·5	27·3	24·5

35. Compared with the average for 1892–1901, all the races, except the Burghers, Tamils, and "Others," and, compared with 1901, all the races, except the Burghers and Sinhalese, show lower death-rates for 1902. The highest death-rate was among the Tamils, 30·5 (against an average of 29·1 in 1892–1901 and 32·9 in 1901). The small community of Europeans showed the lowest death-rate (20·2), followed by the Burghers with a rate of 21·3.

36. *Sex.*—The 99,680 deaths registered during the year included 50,901 males and 48,779 females. The death-rates per 1,000 persons living were 26·4 for males and 28·7 for females, while the average rates for the ten years 1892–1901 were 26·5 and 28·6 respectively. The proportion of male deaths to female deaths was as 1,044 is to 1,000, against an average proportion of 1,053 to 1,000 in the ten years 1892–1901. These proportions are derived from unequal numbers of males and females living, for there is an excess of males in the population. In the year 1902, had the population comprised an equal number of males and of females, there would have been 919 male deaths to every 1,000 female deaths, as against an average in the ten years 1892–1901 of 927 males to 1,000 females.

37. *Age at Death.*—Tables XVI., XVII., and XVIII. in the Appendix give the population, deaths, and their rates for the Island at the different age periods in the years 1902, 1901, and the average for 1892–1901, and Table XIX. gives the infant mortality in the various Provinces and districts in those years.

38. The mortality of males and females separately, and of both sexes together, at the different age periods is compared in the following Table H for the years 1902 and 1901 and the average for 1892–1901 :—

Table H.—Annual Rate of Mortality per 1,000 Living at different Ages.

Ages.	Ten Years 1892–1901.			1901.			1902.			Increase or Decrease in 1902 compared with the Average of 1892–1901.

V.—PUBLIC HEALTH.

39. The general health of the population during the year has been normal, with a mortality rate of 27·5 per thousand, as against 27·6 in the preceding year and an average of 27·5. Compared with the average, only two out of the nine Provinces (North-Western and Sabaragamuwa) show reduced rates, while six (Western, Central, Southern, Eastern, North-Central, and Uva) show enhanced rates. In the remaining Province (Northern) the mortality has remained stationary. Of the districts, in nine (Negombo, Matale, Nuwara Eliya, Mannar, Mullaittivu, Galle, Kurunegala, Ratnapura, and Kegalla) the death-rate has declined ; in the remaining twelve it has increased.

40. The healthiest Province in the Island for the year is the Western, the healthiest district Negombo, and the healthiest subdivision Pitigal korale south of the Chilaw District.

41. Tables VI., VII. (*a*) and (*b*), and XXII. in the Appendix give the births and deaths and their rates in the several districts and subdivisions of the Island. The figures are given for the Sinhalese only in the Sinhalese districts, and for the Tamils only in the Tamil districts. These separate figures furnish more trustworthy data for comparing the relative sanitary condition of these districts and subdivisions than if the rates included other nationalities temporarily resident in them. The infantile mortality is also included—a most valuable index to health. In the Puttalam District, where the Sinhalese, Moors, and Tamils are found in almost equal numbers, and in the Batticaloa District, where the Tamils and Moors are in almost equal numbers, the figures are given for these races separately.

Health of the Sinhalese.

42. Of the total Sinhalese population, the Western Province contains 33 per cent., Southern Province 23 per cent., North-Western Province 13 per cent., Central Province 12 per cent., the Province of Sabaragamuwa 11 per cent., the Province of Uva 5 per cent., North-Central Province 2 per cent., and the Eastern Province ·37 per cent. The health of the Sinhalese has been normal, the mortality being equal to a rate of 26·1, as against an average of 26·6. The subjoined Table I. gives the estimated population at the middle of the year 1902, the births and death and their rates for the years 1901 and 1902, and the average for the years 1892–1901 in the several Provinces :—

Table I.—Sinhalese Population, Births and Deaths, and their Rates in the Provinces of Ceylon in 1892–1901, 1901, and 1902.

Province.	Estimated Population at the middle of the Year 1902.	Births.			Deaths.			Proportion per 1,000 of the Population.

43. *Western Province.*—This Province, which, with only about 6 per cent. of the total area of the Island, contains more than a fourth of its entire population and about a third of its Sinhalese population, maintains, as usual, the distinction of being the healthiest Province in the Island. In the year under consideration the mortality among the Sinhalese, who form the bulk of the population of this Province, corresponded to an annual rate of 20·3. This rate is slightly in excess of the rate in the previous year (19·8) and the average for the decade 1892–1901 (19·2), but is less than half the rate of the unhealthiest Province in the year (North-Central Province, 42·2). The mortality of infants under one year of age, which is generally considered the most sensitive test of the health of a country, is in the proportion of 117 deaths to a thousand registered births—an improvement compared with the previous year (119). It is the lowest provincial rate in the year.

44. The Negombo District is this year, as in the previous year, the healthiest district, not only in the Province, but in the whole Island, with a mortality rate of 17·2 for all ages, and of 108 for infants. This district used at one time to return a higher mortality rate than the other two districts of the Province, but a marked improvement has occurred since 1893 in its sanitary condition, as gauged by the mortality, due, it is believed, to the absence of river floods, which usually follow the south-west monsoon rains generating here, as in most other districts of the wet zone, malarial disease. Alutkuru korale north, the largest and most populous of its divisions, returns a death-rate of 15·8, as against an average of 17·0, regaining the position, which it usually holds, and which last year was held by Hapitigam korale, of being the healthiest division in the district. In Hapitigam korale the death-rate has declined to 16·5 from an average of 20·2, while in the Local Board, the unhealthiest division, the improvement is most marked, the mortality (28·5) being 8·5 per 1,000 less than the average (37·0). But town divisions, such as Negombo, are hardly suitable for purposes of comparison, as their rates are affected by the mortality, in the jails and hospitals, of persons not natives of the place.

45. Of the districts in the Western Province, next to Negombo in point of health ranks Colombo, the most densely peopled district in the Island (704 persons to the square mile, exclusive of the Municipality). Here the mortality rate has risen to 20·8 from an average of 18·8, and every one of the subdivisions, except Hewagam korale, has fared worse than usual. The two divisions of Siyane korale (east and west), which contain a purely agricultural population, the healthiest class of population in any country, are the healthiest, as they are the most populous in this district. In Siyane korale east the mortality was at the rate of 17·4 per 1,000, and in Siyane korale west 16·1. Salpiti korale is, next to the Colombo Municipality, the unhealthiest division of the district. This is a prosperous division, and it is probably due to the fact that an appreciable proportion of its population partake of the urban character (for urban mortality is, as a rule, higher than rural) that its death-rate is higher than that of Siyane korale. The death-rate of Salpiti korale for the year was 20·1 (average 16·7). Alutkuru korale south returned a death-rate (19·6) 3·5 per 1,000 higher than the average, while in Hewagam korale alone, of the divisions of the Colombo District, the death-rate has declined (17·9, as against an average of 20·0). The Colombo Municipality is fully dealt with in a separate chapter devoted entirely to itself (see chapter VIII., page 14). It is only necessary to say here that it is, as usual, the unhealthiest division of the district, and shows for the year a death-rate 3·5 per 1,000 higher than the average. The infantile mortality in this district was equal to a rate of 121 deaths per 1,000 births registered.

46. The Kalutara District is the largest district in the Western Province, and, at present, the unhealthiest. Its mortality rate for the year is 21·3, an increase of 1·6 compared with its average. Rayigam korale and the two divisions of Pasdun korale seem to have enjoyed normal health, while the other two divisions, and notably the Local Board, show a deterioration. The healthiest division of the district is Pasdun korale east (17·8). The death-rate for infants in the Kalutara District (116) was 8 per 1,000 higher than in Negombo, but 5 per 1,000 less than in Colombo.

47. *Central Province.*—In the Central Province the mortality rate for the Sinhalese (30·0) is almost identical with the average (30·6). The deaths among infants were in the proportion of 185 per 1,000 registered births. Of its three districts, Matale shows an improvement in health; in Kandy and Nuwara Eliya the mortality was normal.

48. The death-rate of the Kandy District (28·6) has remained stationary. Four of its subdivisions, viz., Harispattu, Tumpane, Uda Dumbara, and Yatinuwara, have enjoyed better health than

usual. In the remaining six divisions the health has deteriorated. Uda Bulatgama (20·4, as against an average of 18·2) continues to be the healthiest division, not only in the Kandy District, but in the whole Province. The superior sanitary condition of this division is attributed, in a great measure, to the presence in it of an adult male immigrant population, chiefly from Southern India, with a sprinkling of traders and artisans from the Western and Southern Provinces, to its climate, and to the prosperity introduced into it by the large number of tea plantations in it. The highest rate of mortality in the district is that of Uda Dumbara (32·6), but it seems to have fared better than usual, its average being 35·3. The death-rate of the Kandy Municipality has risen to 30·8 from an average of 24·7, an increase of over 6 per 1,000. The rate of infantile mortality of the district was 174 per 1,000 registered births.

49. In the Matale District the mortality rate fell to 36·4 from an average of 40·0. Every one of its subdivisions, except Matale East, where, however, the health has been normal, has shared in this improvement. The improvement of Matale South, where the death-rate has declined by 7·1 per 1,000, is striking. This is the healthiest of the subdivisions, and its rate (30·6) is as much as 11·4 per 1,000 less than in the unhealthiest division, Matale East (42·0). In the remaining divisions, Matale Local Board and Matale North, the improvement that has occurred is hardly appreciable. The Matale District has returned the highest infantile mortality rate for the Province (227).

50. The deaths in the Nuwara Eliya District were equal to a rate of 27·1 per 1,000, which is exactly identical with the average. In two divisions, viz., Nuwara Eliya Local Board (22·0, as against 20·7) and Walapane (32·8, as against 31·2), the mortality has increased; while in the other two divisions, Kotmale (23·4, as against 24·6) and Uda Hewaheta (26·8, as against 27·0), an improvement, though slight, is noticeable. The deaths among infants in this district are equal to a proportion of 172 per 1,000 births.

51. *Southern Province.*—The Southern Province is, next to the Western Province, the healthiest Province in the Island. Of its population no less than 94 per cent. are Sinhalese. The Sinhalese death-rate for the year (25·1) is slightly in excess of the average (24·6). For this increased mortality the Hambantota District is mainly responsible. In the Galle District the health has improved, in the Matara District the increase in the mortality amounts to only ·1 per 1,000, and in the Hambantota District to ·7 per 1,000. The infantile mortality of the Province was equal to a rate of 131 per 1,000.

52. The Galle District, though in area scarcely one-third of the Southern Province, contains about 45 per cent. of its Sinhalese population. The rate of mortality among the Sinhalese in this district was 24·9, as against an average of 25·5. The improvement is confined to two subdivisions, Hinidum pattu and the healthiest division of the district, Gangaboda pattu. In the former the death-rate has declined to 23·7 from an average of 25·1, and in the latter to 21·7 from 23·8. The "Four Gravets beyond Municipal limits and Akmimana" division, which, usually ranks first in point of health among the divisions of this district, comes this year second in order. Walallawiti korale is the unhealthiest division of the district (28·1, against 25·2). The deaths among infants were in this district at the rate of 134 per 1,000.

53. The healthiest district of the Province is Matara, which contains about 36 per cent. of the Sinhalese population of the Province, and where the death-rate for the year (23·1) is well-nigh the same as the average (23·0). In Morawak korale and Wellaboda pattu the death-rates have declined to 26·6 and 20·1 respectively from averages of 30·4 and 21·3, while all other subdivisions show enhanced death-rates. The healthiest division of the district is Wellaboda pattu (20·1, against 21·3), and the unhealthiest the Matara Local Board (32·6, against 28·4). The infantile rate of the Matara District is by far the lowest in the Province (118).

54. The Hambantota District, which is more than double the size, but contains little more than half the population of Matara, has returned an increased death-rate (26·8, against 26·1), an increase shared by three out of its four divisions, the exception being the healthiest division of the district, Giruwa pattu west, of which the rate for the year is the same as the average (24·3). In the Hambantota Four Gravets the increase in the mortality rate from 31·9 to 40·3 is most marked. The increase in the rate of Magam pattu (5·1 per 1,000), too, is considerable. The high infantile rate of this district (162, as against 130 in Galle and 118 in Matara) is of itself evidence of its insalubrity.

55. *North-Western Province.*—The mortality among the Sinhalese population of this Province, who form nearly one-seventh of the total Sinhalese population of the Island, was in 1902 at the rate of 29·5, and shows an appreciable improvement compared with the average (33·3). Every one of its three districts has contributed towards this result.

The infantile death-rate of the Province is as high as 203.

56. In the Kurunegala District, which holds 75 per cent. of the Sinhalese population of the Province, the Sinhalese mortality was equal to a rate of 32·0, against an average of 36·7. This improvement has extended to every one of the subdivisions without exception. Katugampola hatpattu is, as usual, the healthiest division of the district, with a mortality rate of 22·4, as against an average of 24·3. This is a prosperous division, thanks to the large number of cocoanut estates that have been opened in it, and which afford a living to a large proportion of its population. Its infantile mortality rate (103 per 1,000 births) is about half the rate of the district (203). In Dambadeniya hatpattu the death-rate has declined to 25·1 from an average of 34·3. Wanni hatpattu is still the unhealthiest division of the district, with a mortality rate of 42·2 for all ages, and of 335 deaths per 1,000 registered births for infants.

57. The death-rate for the Sinhalese population of the Puttalam District is 38·4, against an average of 39·7; for the Tamils 38·6, against 40·9; and for the Moors 41·5, against 36·6. For the Puttalam District the mortality rates are separately given in Tables VI., VII. (*a*), and VIII. (*b*) for Sinhalese, Tamils, and Moors, who are found in almost equal numbers in the district. The number of registered deaths in the Puttalam District in the year (1,167) exceeds the number of registered births (968) by 199. Kalpitiya shows the lowest death-rate (18·4) in the district for Sinhalese, the Puttalam division (28·8) for Tamils, and the Local Board (33·5) for Moors.

58. The Chilaw District is the healthiest district in the Province, and the second healthiest (Negombo being first) in the Island. Its death-rate shows a slight improvement, having decreased to 18·9 from an average of 19·1. The Pitigal korale south division of this district enjoys the distinction of being the healthiest division of the Island in the year, with a mortality rate of 15·1. The next healthiest division of the district is Pitigal korale central (19·1). These two divisions, which till recently formed one chief headman's division, are among the richest divisions of the Island, and are

inhabited by a most industrious and prosperous population. Pitigal korale north (29·9) is much unhealthier than Pitigal korale south and Pitigal korale central, and is the unhealthiest division of the district. The difference between Pitigal korale north and the other divisions of Pitigal korale is due to difference in soil and climate. The infantile mortality rate of the Chilaw District is 118.

59. *North-Central Province.*—The North-Central Province, the largest Province of the Island, which in the time of the native rulers is supposed to have supported teeming millions, now holds but 2 per cent. of the population of the Island, with a density of 20 persons per square mile. Malaria is the bane of this Province, and has made it the unhealthiest Province in the Island. The Sinhalese death-rate returned for the year under review is 42·2, against an average of 40·8. All the subdivisions are almost equally unhealthy. The rate of the town division is 73·4, but its population is so small that a few deaths more or less cause a serious fluctuation in the death-rate. Of the other divisions, the rates vary from 39·9 in Hurulu palata to 45·9 in Tamankaduwa palata. The infantile deaths in the Province were equal to a rate of 272 per 1,000 births. It is hoped that the Northern Railway under construction and the irrigation works now in hand will introduce prosperity into this Province, the magnificent ruins of which attest its ancient grandeur.

60. *Province of Uva.*—In the Province of Uva the death-rate has slightly risen (40·0, against 39·4). Of its eight subdivisions, four (the Local Board, Yatikinda, Buttala, and Wiyaluwa) have fared better, and four (Bintenna, Wellawaya, Wellassa, and Udukinda) worse than usual. Wiyaluwa ranks first in point of health, with a death-rate of 28·8 as against 37·7, and Wellassa last, with 54·7 against 45·2. The Local Board division shows a substantial improvement, the mortality having declined from an average rate of 38·6 to 30·3. The divisions which constitute "Lower Uva," *i.e.*, Bintenna, Buttala, Wellawaya, and Wellassa, as a rule, return greater mortality than the hilly divisions which form "Upper Uva," and which are well watered and healthy. The deaths of infants in the Province of Uva were in 1902 in the proportion of 209 deaths to 1,000 registered births.

61. *Province of Sabaragamuwa.*—In the Province of Sabaragamuwa the rate of mortality among Sinhalese has diminished by 3 per 1,000 compared with the average (29·6). The improvement is shared by both its districts. The deaths of infants in the Province were in the proportion of 171 per 1,000 registered births.

62. The Ratnapura District, though about twice the size of its sister-district Kegalla, has only about seven-tenths of its population. The Sinhalese mortality in this district was at the rate of 29·4, as against an average of 32·4. The only division of the district which has not returned for the year a reduced mortality rate is Kadawatu korale (the unhealthiest division of the district), in which the rate has increased to 40·4 from an average of 37·2. The Kuruwiti korale is, as usual, the healthiest division of the district (22·4), and shows a substantial improvement compared with the mean rate (27·1). The infantile mortality rate of the district is 186.

63. The Kegalla District is nearly thrice as densely populated as the Ratnapura District. In the former a square mile supports 294 persons, as against 106 in the latter. The deaths in the Kegalla District were in the proportion of 24·4 per 1,000 persons living for all ages, as against an average of 27·2 and of 160 deaths per 1,000 registered births for infants. All the subdivisions, except one, have improved in health. In Panawal korale, the healthiest division of the district, the death-rate has undergone a considerable reduction, from 26·0 to 20·1. The only division which has returned an enhanced death-rate is Dehigampal korale (23·2, against 22·5). The unhealthiest division of the district is Galboda korale (29·4, against 31·3).

HEALTH OF THE TAMILS.

64. Of the estimated Tamil population of the Island, which numbers 963,372, the Indian immigrant population of the estates form more than one-third. The remaining two-thirds are home-born, of whom about 333,000 live in the Northern Province, 98,000 in the Eastern Province, about 75,000 in the Western Province, and the rest are scattered over the other Provinces of the Island.

65. Table L below gives the population, the births and deaths and their rates, for the years 1901 and 1902, and the average for the years 1892–1901 in the several Provinces:—

Table L.—The Tamil Population, Births and Deaths, and their Rates, in the Provinces of Ceylon in 1892–1901, 1901, and 1902.

Province.	Population at the middle of the Year 1902.	Births.			Deaths.			Proportion per 1,000 of the Population. Births.			Deaths.		
		Average 1892-1901.	1901.	1902.	Average 1892-1901.	1901.	1902.	Average 1892-1901.	1901.	1902.	Average 1892-1901.	1901.	1902.

Other Provinces, inclusive of Estates ...	456,935	7,921	8,932	10,185	11,321	16,466	14,184	21·3	19·7	22·3	30·5	36·3	31·1
Total ...	963,372	24,054	28,191	28,759	24,664	31,475	29,352	28·3	29·4	29·9	29·1	32·9	30·5

66. *Northern Province.*—The rate of mortality among the Tamils in the Northern Province is 26·8, as against an average of 26·1. The infantile deaths were equal to a rate of 187 per 1,000 registered births.

67. The Jaffna District contains over nine-tenths of the total population of the Province, with an average density of 238 persons to the square mile, varying from 2,469 in the Jaffna division to one person per square mile in Tunukkai. The deaths among Tamils in this district numbered 7,808 (as against 7,029 in the previous year), and were in the proportion of 25·7, as against an average of 24·6. Of its subdivisions, Karachchi, Punakari, Pachchilaippalli, Vadamarachchi east, Delft, and Tunukkai contain too small a population to yield reliable rates for purposes of comparison. Of the remaining divisions, Valikamam east is credited with the lowest death-rate. It is usually the healthiest division of the district, and in the year under review has experienced slightly reduced mortality (19·9)

compared with the average (20·4). Valikamam north comes next with a death-rate of 20·9 (same as the average), followed by Vadamarachchi west (21·0, against 23·0) and Valikamam west (21·2 against 21·7). In the Jaffna division the mortality rate (32·4) has advanced at the rate of 4·8 per 1,000.

68. In the Mannar District the death-rate has fallen to 35·9 from an average of 39·7, two of its subdivisions sharing in the improvement, the exception being Nanaddan. Since the closing of the northern immigration route this district has been free from cholera, which used to be introduced into it from India by the immigrant cooly. It still suffers from want of wholesome water and food, and, as the Assistant Government Agent says, "every one expects to have fever, and looks on its coming and going as ordinary incidents of life." The last Census disclosed a decrease of the population of the district by 1·9 per cent. The restoration of the Giant's tank, now complete, and the Northern Railway under construction will, it is hoped, result in a material amelioration of the condition of this district. The mortality rates of the subdivisions are Mantai 33·5, Mannar island division 34·6, and Nanaddan 40·4, against averages of 36·3, 43·2, and 36·4 respectively. The infantile mortality rate of the district is 283.

69. The Mullaittivu District is the unhealthiest district of the Province (39·6). Here the registered deaths exceed the births. In the maritime pattus division alone the births are slightly in excess of the deaths. The highest rate of mortality is in Vavuniya north (44·9); in Vavuniya south it is almost as high (40·0). The maritime pattus division has returned the lowest rate (37·1). The deaths of infants in the district were equal to a rate of 254 per 1,000 registered births.

70. *Eastern Province.*—In the Eastern Province there were at the recent Census 56 Tamils and 36 Moors in every thousand of the population. This is the Province with the largest Moor population, which is estimated to have numbered 63,599 at the middle of the year 1902. For the year under report both sections of the community show enhanced death-rates, the Moor death-rate being 29·1 against 27·3, and the Tamil death-rate 30·8 against 28·7. The infantile rate is 223 for the Tamils and 204 for the Moors.

71. Of the population of the Batticaloa District, 55 per cent. are Tamils and 37 per cent. Moors. In the year 1902 there were 29·8 Tamil deaths (average 30·6) and 29·3 Moor deaths (average 27·9) to a thousand of the population. In the Batticaloa Local Board, where the bulk of the population are Tamils, the Tamil death-rate (32·3) has increased by 8·7 per 1,000. In Manmunai pattu north, where the Tamils and Moors are found almost in equal numbers, the mortality of the former was equal to a rate of 28·4 and of the latter to 41·3. The death-rate for the Moors of this division is, as a rule, higher than that for Tamils, owing to a close aggregation of the former, almost the whole Moor population of the division being in one village, Kattankudiyiruppu. The Moors are preponderant in Karaiwaku and Nintavur pattus, which show a lower rate for Moors (26·4) than for Tamils (29·1). In Akkarai pattu the Tamil rate (29·3) is almost identical with the Moor rate (29·0). The divisions with the lowest Tamil mortality are Eruvil and Porativu pattus (24·4), and that with the lowest Moor rate Koralai pattu (21·4). The infantile mortality of the district is 207 deaths per 1,000 registered births for Tamils and 199 for Moors.

72. The Trincomalee District has returned a reduced mortality for Tamils (35·4) compared with the average (36·7). In two of its divisions, Trincomalee town and Kaddukulam pattu, the death-rate has decreased, and in the remaining two it has increased. The mortality rate is lowest in Tampalakamam pattu (34·0 against 31·4), and highest in Kaddukulam pattu, the largest division in the district (41·5 against 47·8). In the town division the rate (34·1), has declined by 5·3 per 1,000, and in the Kaddukulam pattu by 6·3 per 1,000 (41·5 against 47·8). The increase in Koddiyar pattu (from 25·2 to 36·3) is considerable. The deaths of infants in the district were in the proportion of 318 to 1,000 registered births.

Health of the Districts in each Quarter.

73. I give below a table showing the death-rate of each district for each quarter in the years 1902 and 1901 and the average for each quarter in the decade 1892–1901. The districts are arranged according to the moist and dry zones; that is, the region having 60 inches of rainfall and more and the region with less than 60 inches:—

Table M.—Mortality of each Quarter in the various Districts of the Island.

Districts.	Average of the Ten previous Quarters, 1892–1901.				1901.				1902.			
	First Quarter.	Second Quarter.	Third Quarter.	Fourth Quarter.	First Quarter.	Second Quarter.	Third Quarter.	Fourth Quarter.	First Quarter.	Second Quarter.	Third Quarter.	Fourth Quarter.

74. Reference is requested to my quarterly reports published periodically in the *Government Gazette* for more detailed information.

75. The first quarter, as a rule, has the highest death-rates. The exceptions are the hilly districts of Kandy, Nuwara Eliya, Badulla, and Kegalla, and the coast districts of Batticaloa, Trincomalee, Galle, and Negombo.

76. Allowing for delay in the registration of deaths, the unhealthiness of the quarter appears to be due to the extreme variation of temperature in the three months December to February. In the districts above-named the second quarter generally shows the highest rates. In the other districts there is usually considerable decline of mortality from the first quarter. In the third quarter the death-rate still further declines, especially in the region visited by the south-west monsoon, but rises in the fourth quarter. In the second and third quarters the south-west monsoon comes as an unhealthy hot land wind in the Eastern Province, relieved of its moisture by the hills of the Central and Sabaragamuwa Provinces. In the fourth quarter the rains brought by the north-east monsoon fall over the whole Island, and make this quarter the wettest period of the year. The eastern districts, Batticaloa and Trincomalee, are then especially healthy, receiving as they do the breezes direct from the sea. The wind then traversing malarious wastes reaches the plain of the western region as an unhealthy land wind, which, together with the damp caused by the excessive rainfall, contributes much to their unhealthiness.

77. The highest death-rate in the districts for any quarter of the year 1902 was 62·7 in Anuradhapura in the first quarter. In none of the other districts was a rate higher than 55 per 1,000 recorded in any quarter, the nearest approach to it being in Mullaittivu in the first quarter (54·8). The lowest rate recorded in any quarter was 13·8 in Chilaw and 16·9 in Negombo, both in the fourth quarter.

VI.—CAUSES OF DEATH.

78. The registered causes of death are given in Table XXIII. in the Appendix, and are summarised in Table N below. Their distribution among the different Provinces and districts is shown in Table XXIV.:—

Table N.—Mortality from various Causes of Deaths in 1902, 1901, and 1892–1901.

Cause of Death.	Total Number of Deaths.			Proportion of Deaths per Million Persons living.		
	1902.	1901.	Average for 1892–1901.	1902.	1901.	Average for 1892–1901.
Zymotic Diseases	43,771	45,015	45,984	12,058	12,564	12,668
Parasitic Diseases	3,699	3,485	3468	1,019	973	955
Dietetic Diseases	201	279	344	55	78	95
Constitutional Diseases	7,646	8,063	6,875	2,106	2,251	1,894
Developmental Diseases	3,018	2,831	2177	832	790	600
Local Diseases	31,316	29.618	23,967	8,627	8,267	6,603
Violence	1,916	1,924	1,761	528	537	485
Ill-defined and not Specified Causes ...	8,113	7,598	6,304	2,235	2,121	1,736
Total ..	99,680	98,813	90,880	27,460	27,581	25,036

79. *Zymotic or Specific Febrile Diseases.*—This class consists of the diseases most amenable to public control, and most capable of being reduced by sanitary measures. The mortality under this head therefore deserves special attention. Zymotic diseases caused 44 per cent. of the registered deaths in 1902, or 1 per cent. less than in the previous year. The deaths attributed to this class numbered 43,771, and were in the proportion of 12,058 deaths to a million persons living, as against 12,564 in the previous year and 12,668, the average in the period 1892–1901.

80. The rate of mortality from fever has declined to 5,481 from an average of 6,649 in 1892–1901, but shows a rise compared with the rate (5,156) in 1901. The Anuradhapura District heads the list with the highest mortality (15,103 per million) from this cause, followed by Hambantota (14,780 per million), Puttalam (12,368 per million), Mullaittivu (10,831 per million), Batticaloa (10,729 per million), Trincomalee (9,273 per million), Matale (9,246 per million), Jaffna (8,154 per million), Mannar (6,850 per million), Kurunegala (6,484 per million), Badulla (6,103 per million), Ratnapura (4,975 per million), Negombo (4,763 per million), Chilaw (4,648 per million), Colombo (4,135 per million), Kalutara (4,061 per million), Matara (3,349 per million), Kegalla (3,302 per million), Galle (3,046 per million), Kandy (2,880 per million), and Nuwara Eliya (1,654 per million).

81. The mortality from dysentery and diarrhœa was equal to a rate of 5,937 per million of the population, as against an annual average of 6,210 in the period 1892-1901. The district with the highest death-rate from dysentery and diarrhœa was, as in the three previous years, Badulla (11,531 per million), followed by Ratnapura (9,614 per million), Nuwara Eliya (9,034 per million), Kandy (8,949 per million), Matara (7,881 per million), Galle (7,409 per million), Kegalla (6,988 per million), Matale (6,760 per million), and Mannar (5,756 per million). The lowest death-rate from this cause, as in the three previous years, was in Chilaw (1,185 per million), the next lowest being, as usual, Jaffna and Negombo, with 2,479 and 2,565 per million respectively.

82. *Cholera.*—One hundred and thirty-nine deaths were registered this year as having resulted from cholera. Of these, 73 occurred in the Jaffna District, 31 in Negombo, 15 in Colombo, 10 in Kandy, 3 in Kalutara, 2 in Chilaw, and 1 each in Matale, Galle, Kurunegala, Puttalam, and Badulla. Of the 73 deaths in the Jaffna District, 45, though registered in 1902, occurred at the end of 1901 (see paragraph 83 of my report for last year); of the remaining 28, 18 occurred in the year under review at Achchuveli and Kayts in continuation of the outbreak of December, 1901.

83. As regards cholera in the Negombo District, the Principal Civil Medical Officer states that "the disease was introduced from Chilaw by a boatman who was being taken to Colombo ill with the disease. The patient, who was in a padda boat in the Negombo lake, was visited by a resident of Negombo, who contracted the disease. From this source it spread, the localities chiefly infected being Grand street and St. Joseph's street in the neighbourhood of the canal."

84. Of the 15 deaths in the Colombo District, as many as 13 took place at the Ragama Camp, where, according to the Principal Civil Medical Officer, there were six outbreaks of cholera during the year among the coolies who came from infected areas.

85. The 10 deaths in the Kandy District occurred at Pallekele estate, where an outbreak occurred in the last quarter of the year.

86. *Parasitic Diseases.*—Parasitic diseases caused 3,699 deaths, and were in the proportion of 1,019 per million, a rate considerably higher than both the average for 1892–1901 (955) and the rate for the preceding year (973).

87. Under this head was registered dochmius duodenalis or anchylostomiasis as having caused the deaths of 301 persons (against 328 in 1901), of which 68 were in Kandy, 61 in Colombo, 59 in Kegalla, 43 in Kalutara, 23 in Ratnapura, 13 in Badulla, 10 in Galle, 9 each in Nuwara Eliya and Matara, 2 each in Negombo and Kurunegala, and 1 each in Puttalam and Chilaw.

88. *Dietetic Diseases.*—The deaths from these causes numbered 201 (against 279 last year). Of these, 189 (261 in 1901) were attributed to want of breast milk, 6 to chronic alcoholism, 5 to delirium tremens, and 1 to scurvy.

89. Of the 189 deaths attributed to want of breast milk, 131 were Tamils, 46 Sinhalese, 8 Moors, 1 Burgher, 1 Malay, and 2 "Others." Of the total number, 65 occurred in Kandy, 30 in Batticaloa, 26 in Badulla, 12 each in Colombo and Negombo, 9 in Ratnapura, 8 in Nuwara Eliya, 7 in Kegalla, 4 each in Matale and Puttalam, 3 each in Galle and Kurunegala, 2 in Anuradhapura, and 1 each in Jaffna, Matara, Hambantota, and Chilaw.

90. *Constitutional Diseases.*—Constitutional diseases caused 7,646 deaths, and were in the proportion of 2,106 per million, a higher proportion than the average in the period 1892–1901 (1,894). Of the deaths in this class, the most fatal were phthisis 3,297 and anæmia 2,791, rheumatism caused 577 deaths, scrofula 256, cancer 219, diabetes 118, leprosy 101, tabes mesenterica 90, parangi 78, rickets 47, tubercular meningitis 46, and elephantiasis 4.

91. *Local Diseases.*—The deaths under this head numbered 31,316, and accounted for about 31 per cent. of the total number of deaths. They were in the proportion of 8,627 per million, as against an average of 6,603. The increase is probably due to better specification of causes of death.

92. Of the total number of deaths from local diseases, 11,601 (or 37 per cent.) were assigned to the diseases of the nervous system, including 9,855 from infantile convulsions, 592 from tetanus, 423 from paralysis, 146 from apoplexy, 126 from convulsions, 115 from epilepsy, and 57 from mania; 7,012 deaths were caused by diseases of the respiratory system, including 2,939 from pneumonia, 664 from bronchitis, 208 from asthma, 31 from pleurisy, 26 from laryngitis, and 11 from croup. Diseases of the digestive system caused 1,185 deaths, including 254 from diseases of liver, 109 from ascites, 95 from diseases of stomach, 90 from peritonitis, 72 from obstruction of intestines, 70 from dyspepsia, 46 from hæmatamesis, 37 from enteritis, and 30 from sore throat; 590 deaths resulted from diseases of the circulatory system, including 238 from varicose veins, 30 from angina pectoris, 11 from valve disease of heart, and 9 from pericarditis; 334 deaths resulted from diseases of the urinary system, including 102 from Bright's disease, 51 from nephritis, 29 from suppression of urine, and 11 each from uræmia and diseases of the bladder; and 8,091 (or 26 per cent.) from diseases of the integumentary system.

93. *Diseases of Women at Parturition.*—2,309 deaths were attributed to diseases of parturition, including 1,179 from puerperal convulsions, 26 from abortion and miscarriage, 14 from flooding, 1 from phlegmasia dolens, and 1,089 from other and undefined accidents of childbirth. The total number of children registered during the year as born alive was 141,893, so that the mortality of mothers to a 1,000 children born was 16·3. In other words, 1 mother died to every 61 children born alive.

Table O.—Deaths of Women at Parturition.

Nationality.	Deaths of Women at Parturition.			Births.			Deaths of Women at Parturition to 1,000 Births.		
	Average, 1892–1901.	1901.	1902.	Average, 1892–1901.	1901.	1902.	Average, 1892-1901	1901.	1902.
All Races ...	2,091·5	2,068	2,309	115,989·9	134,252	141,893	18·0	15·4	16·3
Europeans ...	·2	—	—	154·8	154	188	1·3	—	—
Burghers	8·5	11	8	493·6	682	708	17·2	16·1	11·3
Sinhalese ...	1,637·1	1,628	1,859	82,713·1	96,262	102,797	19·7	16·9	18·1

Moors ...	145·5	138	143	8,184·6	8,440	8,892	17·7	16·4	16·0
Malays ...	7·2	7	8	263·1	355	362	27·3	19·7	22·1
Others	1·8	—	2	116·4	168	187	15·4	—	10·7

94. *Suicide.*—146 deaths were attributed to suicide, equal to a rate of 40 per million persons living, which is considerably lower than in England, where in 1900 it was 90 to a million. The favourite mode by which suicide is accomplished in Ceylon is by hanging, which accounts for more than half the deaths (86); drowning accounts for 16, poison for 15, and gunshot wounds for 10.

95. *Homicide.*—As many as 135 deaths were attributed to homicide, corresponding to a rate of 37 per million persons living, a rate of 6 per million higher than the average during the period 1892–1901 (31).

96. *Executions.*—There were 31 judicial executions registered during the year. This is 4 less than last year, and corresponded to a rate of 9 per million persons living.

97. *Accidents.*—During the year 1,604 deaths resulted from accident or negligence, giving a mortality rate of 442 per million persons living, or 26 per million more than the mean rate for 1892–1901 (416). Drowning accounts for 385, or nearly 24 per cent., of these deaths. By falling from trees 372 persons lost their lives, by falling from heights other than trees 25, by falling into pits 4. To snake bite were attributed 209 deaths, to rat bite 5, to hornet stings 4, to the bite of a Brahmin lizard 1, to other poisons 45, to burns and scalds 134, to gunshot wounds 67, to injury at birth 69, to fall of heavy substances 69. Alligators caused the deaths of 9 persons, bulls of 6, boars of 5, buffaloes of 5, cheetahs of 5, elephants of 5, horses of 2. One death was caused by a bear, 1 by a deer, and 1 by a dog. 13 persons lost their lives by lightning, 12 by suffocation, 5 by explosions, 2 by sunstroke, and 1 by an accident at cricket. Twenty-four persons were run over and killed by carts, 21 by railway trains, 1 person was killed by an electric tram car, and 1 person met his death by jumping off a tram car in motion.

VII.—BIRTHS AND DEATHS ON ESTATES.

98. The total number of births reported for registration in 1902 from the estates in the Central, Uva, and Sabaragamuwa Provinces, and the Colombo and Kalutara Districts of the Western Province was 9,363 (of which 39 were Europeans, 25 Burghers, 277 Sinhalese, 8,898 Tamils, 95 Moors, 21 Malays, and 8 "Others"); and the total number of deaths was 11,258 (12 Europeans, 10 Burghers, 157 Sinhalese, 10,995 Tamils, 73 Moors, 5 Malays, and 6 "Others").

99. The term "estate" means any land having 10 or more acres in cultivation and situated in a district appointed under the Medical Wants Ordinance, No. 17 of 1880. The Ordinance has been brought into operation only in the districts containing tea, coffee, and other plantations, mainly under European management, viz., in the districts named above.

100. The subjoined Table P gives the birth- and death-rates among the estate population. The Colombo District means here the estates in the Avisawella division :—

Table P.—Birth- and Death-rates among the Estate Population.

District.	Population at the Census of March 1, 1901.	Proportion per 1,000 of the Population.											
		Births.						Deaths.					
		1897.	1898.	1899.	1900.	1901.	1902.	1897.	1898.	1899.	1900.	1901.	1902.
Kandy ...	155,444	24·9	22·4	21·3	21·5	20·0	23·5	22·7	28·3	25·9	30·4	38·1	27·2

Colombo ...	8,302	14·0	14·5	14·9	16·1	14·4	18·3	31·3	40·5	36·4	41·7	54·7	40·2
Kalutara ...	16,965	19·3	16·3	15·1	19·7	16·0	19·9	47·9	46·0	50·6	39·9	50·0	35·2

101. *Kandy District.*—The estate births reported for registration in 1902 numbered 3,653 (16 Europeans, 4 Burghers, 84 Sinhalese, 3,492 Tamils, 50 Moors, 5 Malays, and 2 "Others"), and the deaths numbered 4,226 (4 Europeans, 4 Burghers, 59 Sinhalese, 4,126 Tamils, 31 Moors, and 2 "Others"). The birth-rate for the year (23·5) was 1·5 per 1,000 more than the annual average in the period 1897–1901 (22·0), while the death-rate (27·2) showed a decrease of 1·8 per 1,000 from the average 29·0.

102. Of the 4,226 deaths, 1,579 or 37 per cent. were due to diarrhœal diseases, as against 41 per cent. in the preceding five years 1897–1901. The other most fatal causes were debility 895 (727 the annual average in 1897–1901), pneumonia and bronchitis 297 (average 246), general dropsy 260 (average 185), infantile convulsions 172 (average 166), fevers 170 (average 195), old age 135 (average 114), malarial cachexia 120 (average 176), dochmius duodenalis 45 (average 52), anæmia 44, and phthisis 28.

103. *Matale District.*—The total number of births reported for registration from the estates in the Matale District numbered 559 (2 Europeans, 3 Burghers, 12 Sinhalese, 533 Tamils, 5 Moors, and 4 Malays), and the deaths numbered 917 (8 Sinhalese, 899 Tamils, 7 Moors, and 3 Malays). The birth-rate for the year (21·4) was the same as the average for the period 1897–1901, while the death-rate (35·1) was 2·7 per 1,000 in excess of the annual average (32·4).

104. Of the 917 deaths in 1902, 266 or 29 per cent. were due to diarrhœal diseases, which is almost identical with the average for 1897–1901. Debility (mostly of infants from inability to suck) caused 113 deaths (83 the annual average for 1897–1901), malarial cachexia 111 (average 78), fevers 89 (average 95), pneumonia and bronchitis 85 (average 64), general dropsy 61 (average 36), old age 39, infantile convulsions 38, and anæmia 17.

105. *Nuwara Eliya District.*—The total number of births reported for registration from the estates in the Nuwara Eliya District in 1902 was 2,159 (14 Europeans, 8 Burghers, 54 Sinhalese, 2,060 Tamils, 17 Moors, 4 Malays, and 2 "Others"), and the deaths numbered 2,111 (2 Europeans, 5 Burghers, 28 Sinhalese, 2,067 Tamils, 8 Moors, and 1 "Other"). Both births and deaths show increased rates, the former rising to 20·9 from the annual average (18·8), and the latter to 20·4 from 18·3.

106. Of the 2,111 deaths in 1902, as many as 849, or more than 40 per cent., were due to diarrhœal diseases. The other most fatal causes were debility 404 (262 the annual average for 1897–1901), pneumonia and bronchitis 157 (average 156), general dropsy 93 (average 79), old age 88 (average 62), fevers 83 (average 61), infantile convulsions 80 (average 55), tabes mesenterica 39, and phthisis 22.

107. *Badulla District.*—The total number of births reported for registration from the estates in the Badulla District in 1902 amounted to 1,172 (2 Europeans, 7 Burghers, 20 Sinhalese, 1,134 Tamils, 4 Moors, and 5 Malays), and the deaths numbered 1,212 (2 Europeans, 1 Burgher, 13 Sinhalese, 1,193 Tamils, and 3 Moors). The birth-rate was 22·6, as against an annual average of 22·8, while the death-rate was 23·4, against an average of 22·6.

108. Of the 1,212 deaths in 1902, 425 or 35 per cent. were due to diarrhœal diseases. The other most fatal causes were debility (mostly of infants from inability to suck) 244 (204 the annual average for 1897–1901), pneumonia and bronchitis 161 (average 109), fevers 108 (average 78), general dropsy 40 (average 32), infantile convulsions 28 (average 44), old age 27, and malarial cachexia 13.

109. *Ratnapura District.*—The total number of births reported for registration from the estates in the Ratnapura District in 1902 was 377 (1 Burgher, 4 Europeans, 14 Sinhalese, 354 Tamils, and 4 Moors), and the deaths numbered 573 (1 European, 10 Sinhalese, 560 Tamils, and 2 Moors). The birth-rate during the year (22·6) was 3·6 per 1,000 less than the average, while the death-rate diminished to 34·4 from the average (40·8).

110. Of the 573 deaths in 1902, as many as 285 or nearly 49 per cent. were due to diarrhœal diseases. The other most fatal causes were debility (mostly of infants from inability to suck) 61 (61 the annual average for 1897–1901), bronchitis and pneumonia 28 (average 13), infantile convulsions 24 (average 31), malarial cachexia 22 (average 25), old age 19, fevers 18, dropsy 18, and dochmius duodenalis 17.

111. *Kegalla District.*—The total number of births reported for registration from the estates in the Kegalla District amounted to 953 (2 Burghers, 63 Sinhalese, 876 Tamils, 10 Moors, and 2 Malays), and the deaths numbered 1,287 (3 Europeans, 27 Sinhalese, 1,234 Tamils, 19 Moors, 2 Malays, and 2 Others"). The birth-rate in the district (23·0 was slightly below the annual average for 1897–1901 (25·4), and the death-rate (31·0) showed a decrease of 7·7 per 1,000 below the average (38·7).

112. Of the 1,287 deaths in 1902, diarrhœal diseases caused 496, or over 38 per cent. of the deaths. The other most fatal causes of death here, as elsewhere, were debility, which caused 139 deaths (145 the annual average for 1897–1901), malarial cachexia 115 (average 117), fevers 74 (average 96), infantile convulsions 57 (average 79), old age 54 (average 54), general dropsy 51 (average 37), pneumonia and bronchitis 39 (average 51), and dochmius duodenalis 39 (average 33).

113. *Colombo District.*—This is one of the districts which, as a rule, show very high death-rates and low birth-rates. The number of births reported for registration from the estates in this district was 152 (1 European, 12 Sinhalese, 132 Tamils, 2 Moors, 1 Malay, and 4 "Others") and the deaths numbered 334 (6 Sinhalese, 325 Tamils, 2 Moors, and 1 "Other"). In the year under review the birth-rate increased to 18·3 from an average of 14·8, while the death-rate decreased to 40·2 from an average of 40·9.

114. Of the 334 deaths, as many as 170, *i.e.*, nearly 51 per cent. of the total number, were due to diarrhœal diseases. The chief natural causes of death were fevers 55, debility 25, malarial cachexia 9, infantile convulsions 9, and pneumonia 8.

115. *Kalutara District.*—The number of births reported for registration from the estates in this district was 338 (18 Sinhalese, 317 Tamils, and 3 Moors), and the deaths numbered 598 (6 Sinhalese, 591 Tamils, and 1 Moor). This, like Colombo, is one of the least healthy districts for the estate Tamil population, and, as a rule, shows low birth- and high death-rates. The birth-rate during the year (19·9) is an improvement on its average (17·3), while the death-rate (35·2) shows a decrease of 11·7 per 1,000 from the annual average (46·9).

116. Of the 598 deaths, as many as 210 or 35 per cent. were due to diarrhœal diseases. The other most fatal causes were debility 92 (55 average for the years 1897–1901), fevers 53 (average 33), malarial cachexia 47 (average 33), general dropsy 29 (average 27), pneumonia 26 (average 30), and tabes mesenterica 21.

VIII.—HEALTH OF THE TOWN OF COLOMBO.

117. The number of births registered in the town of Colombo during the year 1902 was 3,681, and corresponded to a rate of 23·0, which is an improvement on the rate for the previous year (20·6) as well as on the average rate for the period 1895–1901 (20·9). The number of deaths registered in the town in 1902 was 5,329. To this should be added the deaths of 35 town patients who died at the Infectious Diseases Hospital at Kanatta (outside the town), and whose deaths were registered by an extra-urban registrar, and the total would then be 5,364, giving a rate of 33·5 per 1,000 persons living. The death-rate was in excess of the average for the period 1895–1901 by ·6 per 1,000, but was lower than the rate for the preceding year by 1·2 per 1,000. The number of deaths registered during the year was 80 less than in the preceding year and 494 in excess of the annual average for the preceding seven years 1895–1901 (4,870).

118. The vital statistics of the town were, for the first time, separately collected in 1887, and at the end of 1892 important changes in the system of death registration were introduced by the Ordinance No. 20 of 1891, which came into operation on the 1st January, 1893. The machinery of registration was improved at the beginning of 1895 by the appointment of stipendiary medical officers as registrars, and still further, in May, 1897, by increasing their number and making the inspection of dead bodies by the registrar compulsory where a certificate as to the cause of death is not produced from a qualified medical attendant on the deceased. The period subsequent to 1892 accordingly shows a marked increase in the number of registered events, especially deaths, compared with the period prior to it.

119. During the period 1895–1902 the average number of deaths registered yearly was 4,932, and in 1887–1892–2,628. The population is estimated to have increased to 149,315 at the middle of the former period from 125,871 at the middle of the latter period. Making allowance for this increase, and assuming that the mortality at the two periods was equal, there should have been registered an average of 4,158 deaths in the period 1887–1892 instead of 2,628. This would show that 37 per cent. of the deaths during this period escaped registration. In 1887–1892 the mean annual mortality of the town was 20·8 per 1,000; in 1893, upon the introduction of the new system of registration of deaths, the death-rate rose to 31·4. The rate rose still higher (33·6) in 1894, and remained about the same in the three succeeding years 1895, 1896, and 1897. In 1898 it fell to 32·1, and still further in 1899 (29·8) from which it rose to 34·2 in 1900 and to 34·7 in 1901, falling again to 33·5 in the year under report.

120. As usual, the death-rate exceeds the birth-rate, owing mainly to the preponderance of males over females, chiefly among the Europeans and among the Indian Tamils and Mohammedans, to the presence of hospitals and jails, which add to the normal mortality of the town, and to registration of births being less efficient than that of deaths.

The birth-rate this year fell short of the death-rate by 31 per cent.

121. *Births and Deaths and their Rates.*—The subjoined Table Q gives the births and deaths and their rates of each race living in the Colombo Municipality for the years 1901 and 1902 with the averages for the periods 1895-1901 :—

Table Q.—Births, Deaths, and their Rates for each Race living in the Town of Colombo for 1901 and 1902, and the Averages for 1895–1901.

Race.	Population (inclusive of the Military) at the Census of 1901.	Births.			Deaths.			Birth-rate per Mille per Annum.			Death-rate per Mille per Annum.*		
		Average, 1895-1901.	1901.	1902.	Average, 1895-1901.	1901.	1902.	Average. 1895-1901.	1901.	1902.	Average, 1895-1901.	1901.	1902.

Others ...	4,548	42	35	56	117	164	153	10·8	7·6	11·5	29·1	35·4	31·4

*These rates have been calculated on population estimated to the middle of the year according to the rate of increase in the last intercensal period.

122. The decrease in the death-rate, compared with the preceding year, is shared by all the races except the Burghers. But the Tamils, Sinhalese, and "Others" show a higher death-rate than the average rates. The Burghers, as usual, show the lowest death-rate (26·0). This is a slight improvement on the average (26·2). The highest death-rate is that of the Tamils (37·5), and the next highest of the Sinhalese (34·0). With the exception of the Moors, who show a lower birth-rate, all the other races show improved birth-rates as compared with the average. The number of births and deaths of the different races in the different wards of the town and their rates per 1,000, the principal zymotic causes of death, &c., are shown in the following Table R :—

[For Table see p. 16.]

123. Omitting the Fort and Galle Face Wards, of which the population is mainly a male adult and floating one, and the Pettah Ward, of which the conditions are similar, the healthiest division during the year was, as usual, the Kollupitiya Ward, with a death-rate of 18·9, as against an average of 20·9 in the period 1895–1901, and 18·7, the rate for the previous year. The highest death-rate was, as usual, in the New Bazaar Ward (30·5, average 30·3). In two of the wards, viz., Pettah and New Bazaar, the death-rates are in excess of the average, while all the other wards show a decrease.

124. For full particulars as to the health of the town in the four quarters and for each week of the year 1902 reference is requested to my quarterly reports published periodically in the *Government Gazette* and to the weekly reports published in the local newspapers.

125. *Causes of Death.*—In the following table the causes of death in the year, which are given in detail in Table XXVII., are summarised and compared with those of the year 1901 and the average for the period 1895–1901 :—

Table S.—Mortality in the Town of Colombo from the Several Classes of Diseases in 1901 and 1902 and the Average in 1895–1901.

Causes of Death.	Total Deaths.			Mortality per 1,000 Living.		
	Average, 1895–1901.	1901.	1902.	Average, 1895–1901.	1901.	1902.
ALL CAUSES ...	4,870	5,444	5,364	32·94	34·70	33·52
Zymotic Diseases	1,546	1,693	1,672	10·46	10·79	10·45
Parasitic Diseases	183	167	137	1·24	1·06	·86
Dietetic Diseases	6	4	12	·04	·02	·08
Constitutional Diseases	537	673	627	3·63	4·29	3·92
Developmental Diseases	376	354	328	2·54	2·26	2·05
Local Diseases	1,732	2,076	2,100	11·71	13·23	13·12
Violence	75	95	95	·51	·61	·59
Ill-defined and not Specified Causes ...	415	382	393	2·81	2·44	2·45

126. The deaths attributed to zymotic causes in 1902 numbered 1,672, and corresponded to a rate of 10·45 per mille, a slight decrease on the rate for the preceding year (10·79), and almost the same as the average rate (10·46) for the period 1895–1901. Of these 1,672 deaths, fevers caused 442 (including 91 deaths from enteric fever), against 460 in 1901, diarrhœa and dysentery 1,042 (against 1,008 in 1901), malarial cachexia 30 (against 91 in 1901).

127. There were two deaths from cholera and one from smallpox registered in the year in the town.

128. Parasitic diseases caused 137 deaths, a proportion of ·86 per mille, as against 1·06 last year and an average of 1·24 in 1895–1901. Of these deaths, 61 were attributed to dochmius duodenalis (against 93 last year), 33 of the victims being Tamils, 20 Sinhalese, 7 Moors, and 1 European.

129. Constitutional diseases caused 627 deaths, a proportion of 3·92 per mille, against 4·29 last year and an average of 3·63 for the period 1895–1901. Under this head phthisis caused 481 deaths (against 504 in the last year), anæmia 50, cancer 26, diabetes 15, leprosy 11, and rheumatism, tabes mesenterica, and tubercular meningitis 6 each.

130. The deaths from local diseases numbered 2,100, being in the proportion of 13·12 per mille, a little lower than last year (13·23), but higher than the average (11·71). Of these, diseases of the nervous system caused 904 deaths (including 422 deaths from infantile convulsions), and those of the respiratory system caused 710 deaths, including 462 from pneumonia and 212 from bronchitis.

131. Violence accounted for 95 deaths, of which 74 were due to accidents. Of these, 21 were attributed to drowning, 10 to burns and scalds, 9 to the fall of a heavy substance, 3 to gunshot wounds, 3 to falls from heights, 4 to suffocation, 7 deaths were caused by carts, 3 by railway trains, 1 by a tram car, 1 met his death by jumping off a tram car in motion, 1 by machinery, and 1 by a horse.

132. Thirteen deaths resulted from homicide. Eight deaths were due to suicide. In 6 of these cases the deceased ended their existence by hanging, 1 by cutting or stabbing, and the other by shooting.

IX.—HEALTH OF THE PRINCIPAL TOWNS.

133. The death-rate of the towns was 35·2 in 1902, as against 36·3 in the previous year and 35·0, the average for the period 1898–1901. The birth-rate was 30·1 in 1902, as against 25·1 in 1901 and 27·8, the average for the period 1898–1901.

134. The following Table T shows the births and deaths and their rates in each of the towns of the Island into which has been introduced the special system of registration of deaths provided in the Ordinance No. 1 of 1895 (sections 31 to 36) for the years 1901 and 1902, with the average for the

Table R.—Births and Deaths and their Rates in the different Wards of the Colombo Municipality, with the Principal Zymotic Causes of Death, in the Year 1902.

Name of Ward.	Population (inclusive of the Military) at the Census of 1901.	Births.										Deaths.																Deaths of Children under One Year.	Deaths of Children under One Year to 1,000 registered Births.	Birth-rate.			Death-rate.

125. Of the twenty-six towns (exclusive of Colombo) included in this table, as many as seventeen have a population of less than 10,000, and eleven of them even less than 5,000, but they are all district headquarters, except Gampola and Nawalapitiya, which are centres of tea districts and important railway stations, and Moratuwa and Panadure, centres of several populous villages. In many of these towns more than half the number of deaths, and in others nearly half, occurred in hospitals which are chiefly resorted to by estate coolies and the destitute poor not resident in the towns. Excluding the hospital and jail deaths, the lowest death-rate was in Nuwara Eliya (11·7), followed by Kegalla (11·8) and Tangalla (16·5). The highest death-rate was in Anuradhapura (47·1), followed by Vavuniya (46·5) and Gampola (34·2).

X.—ADMINISTRATION.

136. The business of the Department was carried on during the year under review with smoothness and regularity. I continued during the year to perform the duties of Superintendent of the Census, in addition to those of the Registrar-General, until the publication, near the end of the year, of the Census Report.

137. In the report on the Census of 1901 has been included a chapter (XXIV., vol. I.) dealing with the vital statistics of Ceylon in the decennial periods 1881–1890 and 1891–1900. In it I have dwelt upon the progress of registration of births and deaths as well as of marriages, analysed the causes of death in the two decades, and recounted the history of vital statistics in Ceylon, and the measures adopted from time to time to remove defects in law and procedure, and to make registration more efficient and the statistical reports what they should be,—storehouses of facts arranged on approved methods, and to which students of vital statistics may resort for the elucidation of questions bearing on the social condition and progress of the people, on life and death, health and disease. The chapter also contains, in addition to the statistical tables, a revised health map of the Island. Chapter XXII. of the Census Report contains a new life table.

138. Mr. J. A. Gunaratna, Chief Clerk of my Head Office, who in February, 1900, was seconded for service as Chief Clerk of the Census Office, reverted on the conclusion of the Census work to the Department in October, 1902, displacing Mr. M. S. Fernando, who was acting for him.

139. In the year under review there were 403 prosecutions for different offences against the Ordinances relating to the registration of births, marriages, and deaths. 365 of these resulted in convictions, 22 in acquittals, in 5 the accused were warned and discharged, in 5 summons could not be served on the accused, 5 cases were pending, and 1 was awaiting trial before the Supreme Court.

Kurunegala, September 5, 1903.

P. ARUNACHALAM,
late Registrar-General.

APPENDIX.

I.—Estimated Population and Number of Marriages, Births, and Deaths registered in the Island in each of the Years 1867–1902.

1902	16·4	38·5	27·5	65	25	36

* The sign minus (—) signifies that deaths exceeded births.

† The births and deaths here shown for 1867 were registered in the ten months commencing March 1, on which date the Ordinance No. 13 of 1862 came into operation.

‡ The number of births and deaths for 1868 includes those registered in the first half-year under the Ordinance No. 13 of 1862, and those in the second half under Ordinance No. 18 of 1867, which repealed the former Ordinance and came into operation on July 1, 1868.

§ The registration of deaths up to 1887 was imperfect, and the figures given cannot safely be compared with those of subsequent years, in which deaths have been registered with increasing efficiency every year.

Table III.—Estimated Population, and number of Marriages, Births, and Deaths, registered in the Island, with their Rates per 1,000 Persons Living, according to Races, in the Years 1901 and 1902, and the Yearly Average in 1892–1901.

* The estimate of the population is based on the Census of March 1, 1901, and the returns of births and deaths since registered.

† Statistics were first separately tabulated for two subdivisions of the korale in 1901.

‡ For Tamil statistics see Table VII. (*a*). For Moor statistics see Table VII. (*b*).

§ Rates are omitted as the population is too small to yield reliable rates.

VI.—Sinhalese Population, &c.—*continued.*

Puerperal mania	·6	2	—
Puerperal convulsions	1,276·6	1,084	1,179
Placenta prævia, flooding	10·2	8	14
Phlegmasia dolens	1·8	5	1
Other and undefined accidents of Childbirth	768·1	927	1,089
Diseases of Organs of Locomotion.			
Caries, necrosis	3·0	—	8
Arthritis, ostitis, periostitis	7·7	5	12
Other and undefined Diseases of Organs of Locomotion	1·7	3	5
Diseases of Integumentary System.			
Carbuncle	35·0	34	32
Phlegmon, cellulitis	12·1	20	12
Ulcer, bed sore	225·3	50	81
Eczema	8·7	5	9
Pemphigus	1·5	5	—
Other and undefined Diseases of Integumentary System	6,265·4	7,430	7,959
Accident or Negligence.			
Fractures, contusions	605·4	656	585
Gunshot wounds	64·0	79	67
Cut, stab	7·0	7	6
Burn, scald	103·7	102	134
Poison	38·1	48	45
Drowning	315·5	367	385
Suffocation	6·4	8	12
Snake-bite	186·8	184	209
Otherwise	183·4	157	161
Homicide.			
Murder, manslaughter	112·9	135	135
Suicide.			
Gunshot wounds	7·1	15	10
Cut, stab	4·1	8	8
Poison	12·2	8	15
Drowning	14·9	24	16
Hanging	68·3	77	86
Otherwise	9·9	14	11
Execution.			
Hanging	21·8	35	31
Ill-defined and not specified Causes.			
General dropsy	2,554·8	2,639	2,791
Debility	3,238·5	4,668	4,899
Sudden deaths (causes unascertained)	17·8	26	21
Abscess	22·1	40	135
Tumour	3·5	13	15
Hæmorrhage	9·4	23	30
Other ill-defined and not specified causes	458·4	189	222

Table XXIV.—Causes of Deaths registered in Ceylon and in each Province and District during the Year 1902.

Causes of Death.	Ceylon.	Western Province.			Central Province.			Northern Province.			Southern Province.			Eastern Province.		North-Western Province.			N.Central Province.	Province of Uva.	Province of Sabaragamuwa.		Deaths among all Races.

FOREST CONSERVANCY.

REPORT OF THE ACTING CONSERVATOR OF FORESTS FOR 1902.

CHAPTER I.

AREAS AND BOUNDARIES.

1. **Forest Areas and Settlements.**—According to the returns furnished by the Government Agents and Assistant Conservators, tabulated in Form 1 in Appendix, the total extent of finally proclaimed reserved forests in the Island at the close of 1902 was 439,632 acres, or 686·92 square miles, of which 161,756 acres were added during the year; of the "proposed reserves," 814,266 acres, or 1,272·29 square miles, 160,401 acres having been excluded during the year in consequence of being proclaimed "reserved;" and of "other forests," 6,854,613 acres, or 10,710·33 square miles, of which 35,820 acres were excluded, having been released and handed over to the care of Government Agents.

2. *Western Province.*—There are four reserved forests in this Province, in extent 4,879 acres, or 7·61 square miles. No additions were made to the reserved area during the year, but a list of five proposed reserves, aggregating 56,058 acres, or 87·58 square miles, is given by the Assistant Conservator, who does not, however, give any information as to what steps have been taken with regard to them, or when they are likely to be proclaimed. He estimates the other "Crown forest" in the Province to amount to 14,000 acres, or 21·87 square miles.

Correspondence passed between the Acting Conservator of Forests and the Assistant Conservator on the desirability of cancelling the reservation of the Ihakadabarawa forest, 1,751 acres in extent, on the grounds of its limited area, irregularity of outline, the existence of numerous holdings and rights within its boundaries, scarcity of valuable timber in it, increasing difficulty of protection, &c. No decision was, however, arrived at, or any recommendation made to Government.

Central Province.—The Government Agent reports the existence of reserved forests to the extent of 990 acres. It is also stated that 8,203 acres are proposed to be reserved. "Other forests" are estimated to be 170,182 acres, or 266 square miles, in extent.

Southern Province.—No reference whatever is made by the Government Agent in his report to the reserved forests in his Province, though, according to the returns furnished for the report of 1901, there were 43 such forests in the Matara and Tangalla Districts, aggregating 131,055 acres. He states, however, that it is proposed to reserve a large area, 130,311 acres according to his report, and 166,400 acres according to Form 1 attached to his report, "of which fully 25 to 30 per cent. is chena," but gives no other information. The extent of the "other Crown forests" is given as 128,000 acres.

Province of Sabaragamuwa.—The Assistant Conservator states that no additions were made to the reserved forests in this Province during the year. In Form No. 1 attached to his report three reserves are entered, which have apparently never appeared in any previous return. Two of these forests seem to have been proclaimed so long ago as 1848, and the third was "proclaimed a second time in 1902."

The Assistant Conservator states that 22,349 acres are proposed to be reserved in the Ratnapura District and 42,906 acres in the Kegalla District, but no further information is given. The extent of "other forests" is estimated at 17,000 acres.

Land is being taken up for reservation in this Province under the Waste Lands Ordinance. Land described as "Ratnapura Town," and 108 acres in extent, was proclaimed a reserved forest in August, 1893. Two of the "forests" in this Province are 7 acres and 4 acres in extent respectively.

Northern Province.—The Assistant Conservator stated in his report for 1901 that the reserved forests in his Circle at the end of the year were three in number, and were 68,507 acres in extent; also that it was proposed to reserve four forests of the total extent of 19,550 acres. In his report for 1902 he gives the total extent of the finally proclaimed reserves on the 1st January, 1902, as 75,297, without any explanation of the discrepancy of 6,790 acres. He also states that six forests, 61,540 acres in extent, were finally proclaimed last year. According to this officer's latest return, there are over 136,837 acres of reserved forests in the Northern Circle and 1,478,139 acres of "other forests."

Proposals were sent in for the reservation of three forests, 47,150 acres in extent.

The Assistant Conservator states that the right of certain villagers to graze cattle in the beds of Veravil tank and Talaivillu tank, in the Mandaklaar reserve, was allowed under section 22 of Ordinance No. 10 of 1885 and gazetted in May.

South-Eastern Circle.—The Assistant Government Agent, Hambantota, who is in charge of this Circle, gives the Yala game sanctuary, 96,000 acres in extent, as the only reserved forest in the Circle. He estimates the "other forests," all in Magam pattu, to be 931,150 acres, or 1,604·93 square miles in all, and describes it to be a "a vast stretch of scrub jungle, with a sprinkling of forest here and there, far between."

The charge of the forests of that portion of this Circle which belonged to the Province of Uva was temporarily given back to the Government Agent, Badulla, during the year, until such time as the services of an Assistant Conservator were available to take over the working of the Circle.

Eastern Circle.—In this Circle no forests have yet been proclaimed as reserves, though more work has been done there in the systematic exploration and demarcation of forests than in any other Circle. The total extent of the Crown forests is estimated by the Assistant Conservator to be 1,638,869 acres, or 2,560 square miles.

North-Western Circle.—The Kalugalla forest in the Kurunegala District, 6,679 acres, which was reported in 1901 as a reserved forest, and as having been finally proclaimed on the 29th September, 1893, is now included by the Assistant Conservator in the list of "proposed reserves," apparently because the final proclamation has, as a matter of fact, not been made. The reservation of the Kankaniyamulla forest, 3,130 acres, which was taken up in 1901, has not yet been completed. Steps were taken during the year to proclaim a large tract of country, 75,000 acres, in the northern part of the Puttalam District as a game sanctuary.

A list of eight forests, aggregating 77,845 acres, is given by the Assistant Conservator as having been recommended by his predecessors for reservation, and he adds four other forests of the total extent of 7,533 acres as suitable.

The total area of the reserves in this Circle are now given as 52,966 acres, of the proposed reserves as 147,943 acres, and of "other forests" as 152,270 acres.

North-Eastern Circle.—The Kantalai forest in the Trincomalee District, 98,861 acres, or 154·47 square miles, in extent, was finally proclaimed during the year, and is the only reserved forest in the Circle. Work in connection with the reservation of two other large forests, 122,720 acres and 187,600 acres respectively, was commenced, but the Settlement Officer, Mr. A. M. Walker, Assistant Conservator, was transferred to the Northern Circle, and the Assistant Government Agent, Trincomalee, was appointed in his place, and ordered to re-commence the settlement *de novo*.

The Assistant Conservator reports four other large forests, aggregating 646,087 acres, to be ready for settlement, but no steps have yet been taken.

Hill Reserves.—The figures given by the Assistant Conservator for 1901 are at variance with those given for 1902. According to the former there were only three finally proclaimed reserves, 1,632 acres in extent, in that Circle. It now appears that there are four or five forests, aggregating 8,580 acres, the largest of which is the Kandapola Sita Eliya forest of 7,256 acres.

An extent of 1,355 acres is reported to have been added to the reserved area during the year at Galboda. This "reserved forest" is no doubt the land purchased by Government for Railway fuel plantations.

Action was taken during the year to reserve the Pedrutalagala forest, 1,600 acres in extent, and the Assistant Government Agent, Nuwara-Eliya, was appointed Settlement Officer.

The Assistant Conservator gives a list of eight other forests, 44,088 acres in extent, which he proposes should be reserved, and states that tracings with schedules of boundaries for 38,000 acres have been sent in. He estimates the area of "other forests" to be 20,000 acres.

3. **Boundaries.**—The demarcation work done by the Department up to 1901 and during the year 1902 is shown in Form 2 annexed to this report.

4. Since this work was taken in hand, two or three years ago, the large sum of Rs. 113,227·86 has been spent on it. The forests in which the work was done are scattered all over the Island. Some were demarcated by 10-ft. lines, others by 6-ft. lines, and others by trenches. The greatest expenditure has been in the North-Western Circle, viz., Rs. 28,993·40, and the least in the Western Province, viz., Rs. 2,871·03. In only two Circles has any real attempt been made to cut up forests into compartments, generally 1 square mile in extent. In the Eastern Circle 61,974 chains of compartment lines have been opened at a cost of Rs. 7,778·45 and Rs. 1,671 spent in re-clearing and widening lines, and in the South-Eastern Circle 3,685·38 chains have been opened at a cost of Rs. 2,615·10.

5. There are now many hundreds of miles of boundary lines, the larger portion cut through wild uninhabited country and demarcating forests, which are not likely to be taken up for systematic working for many years to come. If these lines are not attended to, they will in a few years become overgrown and obliterated. The cost of re-clearing will be very heavy and ever increasing, and is likely to become in time an intolerable burden on the Department.

6. *Western Province.*—No money was spent on demarcation during the year.

The Assistant Conservator reports that the boundary lines of the Kananpella reserve and Ingiriya reserve "have become completely overgrown with bamboo," also that the broad line of about 12 ft. cut round the Labugama reservoir catchment area cannot now be followed.

Southern Province.—Not a cent was spent on demarcation work in this Province during the year.

Central Province.—No demarcation was undertaken in this Province. The Government Agent states that in some forests "the boundaries have become untraceable."

Province of Sabaragamuwa.—The work of demarcating forests in the Kelani Valley reserve, begun in 1900, was continued during the earlier part of the year, but was not completed owing to failure on the part of the contractor, Mr. A. T. Meynert, a surveyor. This man, after giving the Assistant Conservator great trouble by attempts to get payment for "scamped" work, finally bolted from the Island. Owing to the precautions and care taken by Mr. Lewis, Government lost nothing, and the man's cash security of Rs. 200 was forfeited. The work done during the year was the re-clearing of 133·34 chains of lines and the erection of 48 cairns and pillars, for which Rs. 100 was paid. The cost of verification surveys made by the Assistant Conservator was Rs. 51·15.

The Assistant Conservator estimates that up to date some 15,000 acres have been re-demarcated by the clearing and widening of the original lines made by the Survey Department.

The rectification of the southern boundary of the Walankanda reserve has not been carried out owing to claims to enclosed holdings not yet having been adjusted.

Northern Circle.—The sum of Rs. 3,201·82 was spent in demarcation work in ten forests scattered about the Circle. About 2,473 chains of 6-ft. lines and 976 chains of 10-ft. lines were cleared. Some 1,848 chains of 6-ft. lines were widened to 10-ft. and 2,674 chains of lines were re-cleared.

South-Eastern Circle.—The Assistant Government Agent, Hambantota, who is in charge of this Circle, reports that Rs. 1,461·75 was spent in re-clearing and widening the boundaries of two forests, which had become "so overgrown with jungle as to have practically disappeared," and Rs. 302·77 in re-opening compartment lines in the Lunugamvihare forest. He also reports that the demarcation of the Yala game sanctuary is now almost complete, 863·38 chains having been opened during the year at a cost of Rs. 850·56.

Eastern Circle.—Demarcation was confined in this Circle during the year to the cutting out of one-square-mile compartments in the great Koralai forest, a work which has systematically been carried on since 1896. During the last seven years 148 square miles have been demarcated and enumerated, and large quantities of first class timber sold.

During the year 2,000 chains of compartment boundaries were newly opened at a cost of Rs. 208·79, 1,999 chains of rectification lines cut for Rs. 278·54, 1,200 chains of line were finished departmentally at the cost of a defaulting contractor, and 565 chains of 6-ft. lines were widened and cleared of all small trees.

Mr. Moss is one of the Assistant Conservators who have given detailed information in their reports as to the cost per mile of demarcation work carried out. His contract rate for 6-ft. lines was Rs. 11·50 per mile. When, on the failure of the contractor, the work was carried on departmentally, the cost rose to Rs. 12·84 per mile. The widening, &c., of 6-ft. lines cost Rs. 22·95 per mile.

The Assistant Conservator reports that "the old lines are beginning to get overgrown in places."

North-Western Circle.—Demarcation work was carried on in eleven forests in this Circle during the year at a total cost of Rs. 3,884·31. In all 6,131 chains, or 76·63 miles, of boundary lines were cleared, widened, or re-opened, and thirty-eight pillars erected during the year. The work was taken up in all parts of the Circle, but most was done in the Puttalam range.

North-Eastern Circle.—The sum of Rs. 1,929·85 was spent during the year in clearing 757 chains of external boundaries and 6,478½ chains of compartment lines. The cost of supervision amounted to Rs. 238. Much of the work consisted in excising villages and claims in proposed reserves in the Tamankaduwa district. The cost of cutting out the one-square-mile compartments in the Kantalai reserve was Rs. 13·50 per mile for 6-ft. lines; Rs. 24·65 per mile for 10-ft. lines; Rs. 13 per mile for widening 6-ft. lines into 10-ft. lines, which latter rate probably did not include the cutting down of small trees. A firewood block was demarcated by the cutting of 440 chains of 3-ft. lines at a total cost of Rs. 27·50.

Hill Reserves.—Demarcation work was carried out during the year in five forests, and 1,193 chains of boundary cut and 139 pillars erected at a cost of Rs. 1,907·86, which is about two-thirds of what was spent on such work during the two previous years.

The average cost of opening lines in the hill forests is heavy, being Rs. 37·80 per mile, which is more than three times the rate paid in the Eastern Circle. The cost of erecting pillars was Rs. 3 each.

CHAPTER II.

SURVEYS AND WORKING PLANS.

7. **Surveys:** *Western Province.*—No forest surveys for reservation, &c., were made, but the Assistant Conservator made surveys of two small blocks for firewood supply to Sarana estate and the Moragalla mine at a cost of Rs. 41·25.

Province of Sabaragamuwa.—The only surveys made in this Province were by Mr. F. Lewis, Assistant Conservator, "for the purpose of setting apart fixed areas for fuel supply to estates" at a total cost of Rs. 152·71. The following were the surveys made :—

	A.	R.	P.
At Kahaowita	16	3	35
At Dehiowita	20	0	0
At Digalla	17	1	19
At Pambegama	14	0	15
At Udabage	75	0	0

The Assistant Conservator also surveyed the Edangoda rubber plantation, 17 acres 1 rood 33 perches, at a cost of Rs. 13·41.

Eastern Circle.—A prismatic compass survey was made by Mr. D. E. Tiathonis, Forest Ranger, of thirty teak plantations at Rugam, Tumpalancholai, Devilanai, and Puluganavi, at a cost of Rs. 275·71. The total extent of the plantations was found to be 767 acres and 2 perches, which was 57 acres and 2 perches in excess of the estimated extent. Chain surveys of 2,000 chains of compartment lines and 1,257·7 chains of rectification lines were made at the cost of Rs. 24·39 and Rs. 50·10 respectively.

North-Western Circle.—The Forest Ranger, Kurunegala, was engaged during the year in surveying the boundaries of the Mi-oya forest, but was not able to complete the work owing to his having to attend to other and urgent work.

8. **Enumeration Surveys:** *Western Province.*—A detailed enumeration survey of a small forest called Kudametidola, a few miles to the north of the Labugama reservoir, and 82 acres and 28 perches in extent, was made by Mr. F. Lewis, Assistant Conservator, at a cost of Rs. 84·50, or

Re. 1·03 per acre. The results of the survey will be found tabulated in the appendix. The jak trees in the Pohonoruwa plantation at Mirigama were enumerated during the year at a trifling cost.

Province of Sabaragamuwa.—The enumeration of the dun trees in the leased area at Morahela, commenced in 1901, was continued during the year by Mr. H. S. Dias, Forest Ranger, but the excessively wet weather, which practically continued for six months, prevented its completion. The number of trees enumerated numbered 4,000, however, and the work cost only Rs. 68·87. The following is the classification of the trees found and measured up to date :—

Class I.	878
Class II.	590
Class III.	797
Class IV.	851
Class V.	884

North-Central Province.—Captain A. M. Walker, who was appointed to stamp for sale all the saleable timber in the beds of ancient tanks in this Province which it is proposed to restore, reported himself to the Government Agent on the 10th October, and was instructed to commence work in the Maha Illupalama tank. He reported a month later that there was no timber worth taking out of that tank bed, and was instructed to make a similar inspection of the bed of the Galkulama tank, which work he had in hand at the end of the year.

Northern Circle.—The Assistant Conservator was employed during the year in stamping for sale all the exploitable trees standing within the contour line of the great tank about to be made at Iranaimadu.

Eastern Circle.—A complete enumeration survey of fifty one-square-mile compartments in the Koralai forest was made during the year at a cost of Rs. 2,079·12, or Rs. 41·58 per mile. These compartments gave better results than those enumerated last year. An average of 2,567 trees per square mile were found, against 1,719 trees per square mile in 1901, and the average number of matured trees marked for sale was 214 per square mile, against 95 trees in the previous year.

North-Western Circle.—The Assistant Conservator reports that six enumeration surveys were made in his Circle, over 537 acres, at a total cost of Rs. 489·79, with the following results :—

	Trees.	Small Timber.	Warichchies.
Kurunegala Range	1,137	—	—
Chilaw Range	11,605	6,899	6,565
Puttalam Range	—	14,380	16,148

North-Eastern Circle.—Complete enumeration surveys were made of nine one-square-mile compartments in the Kantalai forest at a total cost of Rs. 592, or Rs. 65·77 per square mile, which is a high rate, more than half as much again as the cost of similar work in the Eastern Circle. This is, however, to be accounted for by the great difficulty of getting, and the cost of, labour in the Circle.

The following statement gives the results of this enumeration :—

Description of Trees enumerated.	Number and Class of Trees enumerated.					
	I.	II.	III.	IV.	V.	Total.
Ebony	555	1,822	2,876	4,541	3,161	12,955
Satinwood	117	377	851	1,315	594	3,254
Halmilla	2	326	1,205	2,168	1,904	5,605
Milla	866	1,870	1,685	1,286	700	6,407
Palai	1,224	2,298	2,687	3,677	2,412	12,298
Ranai	291	1,265	2,031	2,919	2,252	8,758
Kalothi	53	196	88	49	16	402
Kumbuk	247	410	101	59	55	872
Illuppai	151	467	212	90	78	998
Other species	1,344	654	213	38	53	2,302
Total ...	4,850	9,685	11,949	16,142	11,225	53,851

Hill Reserves.—The Assistant Conservator states that complete enumeration surveys were made of the standing trees in three blocks, 94 acres in extent, in the Kandapola forest. He reports that the exact number of 24,000 trees were enumerated, but gives no information as to their description or classification.

9. **Sample Plots**: *Western Province.*—The Assistant Conservator reports that the annual measurements of the hora sample plots at Mirigama could not be made at the time when they were usually taken, owing to "long-continued torrential rains."

Northern Circle.—No new sample plots were made during the year. The results of the annual measurements of the trees in the existing plots are given in the appendix.

Eastern Circle.—The four sample plots in the Koralai forest were measured, and the results are given in the appendix. The Assistant Conservator reports that a few of the trees have died.

North-Western Circle.—A new sample plot, 2 acres in extent, was selected in the Kankaniya-mulla forest, in which 184 del, 10 milla, 4 dawata, and 2 godapara were measured and marked.

There are now seventeen sample plots in this Circle. The measurements for the year of the trees marked in them are given in the appendix.

North-Eastern Circle.—The three sample plots at Ratmalai were measured, and the results are shown in the appendix. The Assistant Conservator reports that the trees standing in the plots in which the undergrowth has been cleared away showed the greatest increase in girth.

Hill Reserves.—No new sample plots were made, but the existing ones were measured, and the results are shown in the appendix.

CHAPTER III.

PROTECTION AND IMPROVEMENT.

10. **Superior Staff.**—The following statement shows the appointments held by the different officers of the Department during the year :—

Conservator of Forests ...	...	Mr. Alfred Clark acted from 1st January to 15th June, and Mr. H. F. C. Fyers for the rest of the year.
Assistant Conservator of Forests, Western Province and Province of Sabaragamuwa	...	Mr. F. Lewis throughout the year.
Assistant Conservator of Forests, Northern Circle		Mr. H. P. C. Armitage throughout the year.
Do.	North-Eastern Circle	Mr. A. M. Walker from 1st January to 15th June, when he took up duties as Office Assistant to the Conservator of Forests till the end of the year. Mr. G. D. Templer assumed charge of the Circle on 16th June.
Do.	Eastern Circle ...	Mr. E. L. Boyd Moss throughout the year.
Do.	South-Eastern Circle	The Assistant Government Agent, Hambantota, was in charge throughout the year.
Do.	North-Western Circle	Mr. H. R. Spence throughout the year.
Do.	Hill Reserves ...	Mr. H. F. C. Fyers throughout the year from the 16th June, in addition to his duties as Acting Conservator of Forests.

11. Mr. D. T. Barry, who had been in training in Europe for the Forest Department for the past two and a half years, arrived in the Island towards the close of the year, and was sent on the 20th November to Nuwara Eliya to act as Office Assistant to the Assistant Conservator, Hill Reserves, but was transferred to the Head Office, Colombo, on the 15th December.

12. Capt. A. M. Walker, a pensioned officer of the Department, was appointed on the 10th October Superintendent of Enumeration Surveys in the North-Central Province, and continued in office till the end of the year.

13. The following Assistant Conservators received during the year increases of salary specified below from the dates mentioned :—

	From	To	From
Mr. Alfred Clark ...	Rs. 6,250 ...	Rs. 6,500 ...	March 1, 1902
„ H. F. C. Fyers ...	„ 5,250 ...	„ 5,500 ...	do.
„ H. R. Spence ...	„ 4,750 ...	„ 4,875 ...	Sept. 1, 1902
„ E. L. Boyd Moss ...	„ 4,625 ...	„ 4,750 ...	March 1, 1902
„ F. Lewis	„ 4,375 ...	„ 4,500 ...	Sept. 1, 1902
„ H. P. C. Armitage ...	„ 4,125 ...	„ 4,250 ...	March 1, 1902
„ G. T. Gillam ...	„ 2,200 ...	„ 2,300 ...	Jan. 1, 1902

14. **Executive Staff.** *Western Province.*—Mr. H. O. Jonklaas and Mr. E. C. Fernando served as Forest Rangers at Kalutara and Matugama respectively throughout the year. Mr. H. W. Wickremasekera acted as Forest Ranger at Hanwella from 1st January to 12th February, when he was transferred to Dambulla, his place being taken by Mr. J. F. Cooray, who held the appointment till the end of the year, except for a brief period when he was given special duty at Mirigama in connection with the supply of fuel to the Railway.

Central Province.—The Government Agent states : "Under the Government Agent are two Forest Rangers, and there is one under each of the Assistant Government Agents. Forest watchers, an increase in the number of whom has been sanctioned this year, are employed under the Rangers." He adds: "A large part of the work, especially in the Nuwara Eliya District, consists of reporting on applications for chenas and for the purchase of land." None of these officers, who appear to be headmen rather than forest officers, are under the control of the Conservator of Forests.

Southern Province.—Mr. A. Erskine, Forest Ranger, left for England on twelve months' leave early in the year.

Province of Sabaragamuwa.—Mr. E. Dassanayaka and Mr. H. S. Dias acted as Forest Rangers at Kegalla and Gahawattahina respectively throughout the year.

Northern Circle.—Mr. A. M. Eddirmannasingam and Mr. M. Paul were Rangers of the Jaffna and Mannar ranges respectively throughout the year. Mr. S. Perera was in charge of the Mullaittivu range till the 19th February, when he was transferred to the Hill Reserves, and was succeeded by Mr. W. R. de Silva.

South-Eastern Circle.—Mr. C. A. Bartlott acted as Forest Ranger throughout the year under the orders of the Assistant Government Agent, Hambantota.

Eastern Circle.—The Assistant Conservator writes very appreciatively of the services of Mr. C. B. Outschoorn, Forester, who appears to have supervised the greater part of the forest work of the Circle. The work of the Third Ranger, Mr. D. E. Tiathonis, was chiefly the completion of a prismatic compass survey of the numerous teak plantations in the Circle.

North-Western Circle.—Of the Forester and two Rangers of this Circle, two, Mr. S. O. Felsinger, Forester at Puttalam, and Mr. A. B. Fontyn, Ranger at Kurunegala, served throughout the year. Mr. J. F. Cooray acted as Ranger at Dambulla up to 31st January, and was succeeded by Mr. H. W. Wickremasekera.

North-Eastern Circle.—Mr. J. Eddirmannasingam and Mr. G. Jayawardena, Forest Rangers, served throughout the year. Mr. F. A. de S. Jayatilleka, Ranger, was transferred on account of ill-health to Nawalapitiya in the latter part of November, and was succeeded by Mr. E. W. Ferdinands.

Hill Reserves.—The only change in the executive staff was the transfer of Mr. W. R. de Silva, Forest Ranger, Agrapatana, to the Northern Circle. He was succeeded by Mr. S. Perera.

15. **Clerical Staff:** *Head Office.*—Mr. J. C. de S. Goonesekera was promoted as Clerk in the Irrigation Department, and was succeeded by Mr. S. Kanagaratnam on 10th November.

Southern Province.—Mr. G. L. Dissanaike, Clerk and Depôt-keeper, was transferred to the Hill Reserves, and his place was taken by Mr. W. H. L. Amerasekera.

16. **Protective Staff:** *Western Province.*—Five Forest Guards were employed at Mitrigala, Molkawa, Badureliya, Pasdun korale west, and Alutgama respectively. The Guard at the last-named place acted as Depôt-keeper also. A river watcher, of whose services the Assistant Conservator writes highly, was employed at Demodara checking station.

Province of Sabaragamuwa.—Two Forest Guards were stationed at Ratnapura and one at Kegalla. Two river watchers, paid from the Felling Vote, were employed at Kudagama in checking the transport of timber on the Kelani-ganga.

North-Western Circle.—The Assistant Conservator reports that the pay of the six Forest Guards allowed to his Circle, viz., one at Rs. 15 and five at Rs. 12·50 per month, is quite insufficient to obtain the services of trustworthy men.

17. **Temporarily employed Staff.**—Special returns were obtained for the Administration Report of 1901 of officers employed, in addition to the permanent staff, in supervising forest work, and it was found that the large amount of Rs. 17,990·24 had been spent that year in paying their wages.

18. **Chena Cultivation:** *Central Province.*—The Government Agent states that 897 applications for chenas were reported on by his forest officers during the year.

Northern Circle.—The Assistant Conservator writes: "There was no illicit chena cultivation in the Circle during the year."

Eastern Circle.—Licenses were issued to 286 Sinhalese and Veddahs for the cultivation of 286½ acres. Rent to the amount of Rs. 1,506·25 was collected and credited. The Assistant Conservator makes no reference to illicit chena cultivation, which is a very common offence in this Province.

North-Eastern Circle.—No licenses were issued, and only one case of illicit cultivation was reported, which, however, could not be prosecuted, as no reliable evidence was obtainable.

19. **Forest Fires:** *Eastern Circle.*—The Assistant Conservator reports that the usual grass fires swept over the "talavais" or plains in his Circle during the dry weather, and that a certain amount of damage was done to the teak plantations. The attempts made to protect these small scattered plantations proved quite useless, as the fires passed over the fire lines which had been opened, and set alight the grass and dead leaves inside, thus scorching the young trees. These fires are caused by cattle boys and people searching for deer horns, honey, wild yams, &c., and it is extremely difficult to catch them in the act.

North-Eastern Circle.—The forest fires in this Circle are stated by the Assistant Conservator to have been "disastrous" in their effects, but he gives no estimate of the amount of damage done. He expresses the opinion that "unless very stringent measures are taken to prevent this utter destruction of valuable forests, these forests will be exterminated," but such a fate may happily be regarded as rather remote.

Hill Reserves.—Grass fires occurred at Galboda and other parts of the Circle, and a certain amount of damage was done to plantations and clumps of forest. The efforts made to discover how the fires originated met with no success.

20. **Breaches of Forest Law:** *Western Province.*—The Assistant Conservator reports that there has been a marked increase in the commission of forest offences, chiefly in illicit timber felling, and gives the following figures for the past three years to prove his assertion :—

	1900.	1901.	1902.
	Rs. c.	Rs. c.	Rs. c.
Value of confiscated timber ...	1,417 82	1,665 46	1,742 80
Sums recovered as fines for forest offences ...	284 62	1,108 67	669 11

He adds that 172 forest offence cases were disposed during the year in the Kaiutara Police Court and five cases in the Panadure Court, resulting in the conviction of 224 persons in 158 cases.

The Assistant Conservator does not express any opinion as to the reason for this bad state of things.

The checking station at Demodara for the regulation of timber transit on the Kelani-ganga is reported to have served its purpose well, but no figures are given by the Assistant Conservator as to the quantity of timber checked or other work done. Another station is about to be established at Hanwella, which, it is hoped, will prove equally successful.

Central Province.—The Government Agent reports: "Thefts of firewood still continue to some extent from forests, such as Udawattakele, close to Kandy. The appointment of the extra watchers should do something to diminish this." He adds: "Rules under the Forest Ordinance are under consideration, which should make conviction (in the forest offence cases) more certain."

Southern Province.—The report of the Government Agent discloses a serious state of things as regards forest offences. He states: "There have been many more prosecutions last year under breaches of forest rules compared to 1901. Chena cases still stand out very prominently. They amount to the large number of 2,257." Some cases of illicit digging of plumbago on a large scale on Crown land were brought to light by the Forest Department. The accused paid heavy compensation, and the lands where the mineral was dug are expected to realize high prices.

Province of Sabaragamuwa.—The Assistant Conservator gives particulars of five important land cases tried during the year under the Waste Lands Ordinance, in which the Forest Department was called upon to establish the proof of the claims of the Crown, with very satisfactory results.

In the Kitulpe case, which was based on a spurious royal grant, and in the Ellegedara and Badabelgoda cases judgments were given in favour of the Crown, but the first two are in appeal.

The important Yainna case was also settled in favour of Government. It involved a question of rights to forests within areas claimed as covered by sannas grants. The Assistant Conservator reports: "It will be remembered that in the historical Dehigama case the District Judge of Kandy based his main point of finding on the ruling of the Supreme Court in the Yainna case, and in order to shake that judgment an effort was made to carry the Yainna case to the Privy Council. This could only be effected by proving that the value consideration was above Rs. 5,000, which, on affidavit, I swore it was not. An appeal was taken on this, and the case was sent back to the District

Judge of Ratnapura to investigate the evidence on the point, and upon me again devolved the duty of establishing my affidavit. The District Judge of Ratnapura again found in my favour, and his finding was appealed against, and the matter was brought before the Collective Court of the Supreme Court for final argument, with the pre-eminently satisfactory result that the judgment of the lower court was affirmed, thus ending a much-fought-over question, and opening a precedent in cases of so-called sannas grants."

The Kalalella case was settled out of court, and the Assistant Conservator was instructed to demarcate the Crown share of the land.

In all these cases the zeal and ability shown by Mr. F. Lewis, Assistant Conservator, is deserving of commendation.

Northern Circle.—Only one case of removal of timber without a permit was detected and prosecuted, but it was dismissed.

South-Eastern Circle.—The Assistant Government Agent, Hambantota, reports : "There have not been any thefts of valuable timber, the local requirements of the people being only a few sticks and posts, which are easily procurable from private lands." There were two prosecutions for trespass on the game sanctuary and for removal of timber without a permit, and compensation was accepted in another case of trespass and for capturing a wild buffalo.

Eastern Circle.—Only one forest offence case was instituted by the Forest Department. It was tried in the Kalmunai Police Court, and the three accused were fined Rs. 10 each for illicit felling and removal of timber.

North-Western Circle.—Six cases were instituted in the Kurunegala Police Court, and convictions secured in three. The other three were postponed, and were pending at the end of the year. Forty cases were dealt with under section 71 of Ordinance No. 10 of 1885, and compensation amounting to Rs. 122·50 was recovered and credited to Government.

North-Eastern Circle.—No forest offence cases were referred by the Assistant Conservator to the court, but eight cases were inquired into by him and were compounded. Eight cases, instituted by headmen, of unauthorized felling and chenas were tried in the Trincomalee Police Court, but only three convictions were obtained.

Hill Reserves.—Three cases were instituted, and the accused in two were convicted. Twenty five cases of petty thefts of firewood, &c., were inquired into, and compounded by the Assistant Conservator.

21. **Natural Reproduction.**—The following statement embodies reports of the Assistant Conservators on the seed and seedling crops of the principal forest trees in their Circles during the year :—

Seeding of Forest Trees and Seedling Crops during 1902.

Species.	Western Province.	Central Province.	Southern Province.	Province of Sabaragamuwa.	Northern Circle.	North-Eastern Circle.	Eastern Circle.	North-Western Circle.	South-Eastern Circle.	Hill Reserves.

Kokatiya ... Garcinia terpnophylla ...	M ?			G ?	?		—	B ?		?

N.B.—G stands for Good.
F ,, Fair.
M ,, Moderate.
B ,, Bad.
? ,, No report given.

The first letter stands for seed crop, the second for reproduction.

22. *Western Province.*—The Assistant Conservator reports that "the year 1902 will probably be long remembered for the extraordinary amount of rain that deluged the country during the last four months of the year." Quantities of seed from the previous fall were either washed away or rotted, with a consequent diminution in the seedling crop. The effect in the leafing of deciduous plants was also remarkable, tending, especially in the case of hora, to a remarkable uneven condition. The same peculiarity was noticeable in certain examples of ficus. On the whole, the natural reproduction of species in 1902 was bad, and both flower and fruit were lost.

Province of Sabaragamuwa.—The unusually heavy rainfall during the latter part of the year affected this Province more than most. The natural results were, as the Assistant Conservator states, "a diminution of successful seed results, as well as in the succeeding flowering of individual species." Mr. Lewis reports the re-discovery of an isolated patch of *Stemonoporus Lewisii* in full fruit in a forest on the borders of the Peak Wilderness. He also refers to the finding of the male and female flowers of calamander, and records a second instance of this tree fruiting twice in two succeeding years.

Eastern Circle.—In the northern range the seeding of satinwood was good and that of palai very bad. In the southern range milla and kumbuk seeded well.

North-Western Circle.—The Assistant Conservator devotes considerable space in his report to natural reproduction. Ebony seeded very well in the Kurunegala and Dambulla ranges, but very badly in the Chilaw range. Satinwood seed crops were fairly good in the Puttalam and Dambulla ranges, but were bad in other ranges. Halmilla and milla did well in all parts of the Circle. The seed crop of palu was very good in the drier parts of the Circle, but was very bad in the Kurunegala range. Na seeded fairly well in three of the ranges, but badly in the Dambulla range. Kumbuk, mi, kina, damba, pehimbiya, and hora all seeded well, and there were good crops of seedlings.

North-Eastern Circle.—While the Assistant Conservator in charge of the forests of the Western Province and the Province of Sabaragamuwa complains of unusually heavy rains having destroyed the seed crops, the Assistant Conservator of this Circle, on the other side of the Island, attributes the bad seeding of the forest trees to "the exceptionally dry weather" in the earlier part of the year. He adds, moreover, that the heavy rains which fell during the last few months gave good prospect of heavy seed crops next year.

Hill Reserves.—The Assistant Conservator reports that, on the whole, the year was a good one for seed crops and the reproduction fair; kina, sapu, damba, mihiriya, and madol especially seeding freely.

23. **Artificial Reproduction.**—A statement (No. 4) showing the area of and receipts and expenditure on plantations is given in the appendix. The total area amounts to only 1,291 acres, on which Rs. 84,642·85 has been spent up to date. The expenditure for the year amounted to Rs. 10,605·77, and the receipts from thinnings, &c., to Rs. 3,780·36.

24. *Western Province.*—The sum of Rs. 3,000 was allotted to this Province for the opening of 250 acres at Mirigama as a railway fuel plantation, but none of the money was spent. The Assistant Conservator writes: "I am sceptical as to the financial results of such an undertaking."

A few of the trees in the jak plantation at Kalutara fruited during the year, and the Assistant Conservator is hopeful that in a few years the sale of the right to collect the fruit will prove remunerative. The sum of Rs. 165·49 was spent in upkeep.

The small teak plantation at Kotadeniya having "begun to show symptoms of defunction," some of the trees were felled, and the timber disposed of to the District Road Committee at a good price.

The Hanwella teak garden is not thriving, the small trees having "reached a size beyond which they do not advance."

In the mixed plantation of jak, lunumidella, and domba at Mirigama, the last only appears to be doing well.

Province of Sabaragamuwa.—The right to collect latex in the Yatipowa rubber plantation was sold for Rs. 1,000. No attempt was made to tap the trees in the Korossa plantation, near Rumbukkana, owing to their small size. There was also no demand for seed, and none was sold. The upkeep cost Rs. 252·50, which was high for 27 acres, but the expenditure was necessitated by patches of illuk grass having to be rooted out.

Steps were taken to encourage the experimental cultivation of rubber under irrigation, and there is prospect of land being taken up in this Circle for that purpose.

Eastern Circle.—Little was done in the teak plantations, except to keep the fire lines clear, which, however, did not save the trees in some of them from their almost annual scorching.

North-Western Circle.—No additions were made to plantations during the year. In the Sundapola plantation (92 acres) Rs. 224·16 was spent in repairing roads and weeding. Only Rs. 20·50 was realized by sale of firewood, &c. The sum of Rs. 326·80 was spent on the Badegamuwa plantation (26 acres) in weeding, and in dibbling in 42,064 del and 3,500 jak seeds. Rs. 45·42 was realized by the sale of timber and firewood. The upkeep of the Kumbalpola plantation (10 acres) cost Rs. 22·50. The Assistant Conservator considers that this plantation is not worth further expenditure. The Puttalam teak plantation (59 acres) now requires thinning out. The sum of Rs. 300 was spent in weeding it, &c.

Hill Reserves.—The Assistant Conservator reports as follows on the plantations in his charge:—

Galboda Fuel Plantation.—In 1889 some 759 acres of patana and jungle land were taken up for plantation to supply fuel to the Railway Department. This area consisted of four separated blocks situated at Galboda, and are known by the following names: (1) Penhros, (2) Mapakanda, (3) Dekinda, and (4) Blackwater.

In 1901 Government purchased the old abandoned Kintail estate, consisting of 768 acres 3 roods 29 perches, which separated Mapakanda, Dekinda, and Blackwater blocks from each other. The total area now consists of 1,355 acres.

Previous to 1902, 377 acres were planted, and during this year 60 acres were added, bringing up the planted area to 437 acres.

The first four blocks of patana land were planted in 1890, as follows:—Penhros 56 acres, Mapakanda 192 acres, Dekinda 60 acres, and Blackwater 69 acres; total 377 acres.

(*a*) *Penhros.*—With the exception of about half an acre of eucalyptus, two acres of was *Cassia siamea*), and ten acres of Grevillea robusta, all the rest of the exotics completely died out, and it was found necessary to re-plant this with indigenous plants, such as jak, damba, pepiliya, and pehimbiya. The growth of these has been good, and leaf canopy has formed in many places. The approximate height of jak is 36 ft., with a girth of 1 ft. 8½ in., damba 32 ft., girth 9 in., and pepiliya 12½ ft., with a girth of 5 in. Thinnings gave 125 cubic yards of firewood, which was sold to the Railway Department for Rs. 147·84.

(*b*) *Mapakanda.*—This block has given much trouble owing to its bad soil. Most of the exotics failed, and practically the whole block was re-planted with indigenous plants. All the low-lying portions have now formed leaf canopy, and there is a remarkable improvement every year in the growth of most of the species.

(*c*) *Dekinda.*—This block has grown well, and is the most successful. The whole was re-planted in 1893. Eucalyptus robusta has done well.

(*d*) *Blackwater.*—This is the worst block, and is practically abandoned. The soil is very poor. It was orginally planted with Acacia decurrens, Acacia melanoxylan, Eucalyptus robusta, &c. In places a few patches are to be seen growing, but, taking it as a whole, it is a poor plantation.

(*e*) *Kintail.*—During the year 60 acres of patana land were cleared and planted with Eucalyptus robusta, Eucalyptus citriodora, Eucalyptus resinifera, and jak. On the 31st December the plants had attained a height of 18 in. to 4 ft., and with very few vacancies to be seen.

The following was the expenditure during the year :—

	Rs. c.
Burning patana, clearing, holing, lining, roading, draining, and planting 60 acres	3,806 31
Construction of new cart road to wire shoot	908 19
Restoration of Kintail tank bund	474 70
Construction of three sentry lines and one store, and repair of existing buildings	801 81
Weeding, &c.	330 0
Cost of plants and seeds	102 65
Total ...	6,423 66

Nanu-oya Strip Plantation.—In these plantations the Eucalyptus robusta are doing fairly well, but the strips with Eucalyptus globulus and Acacia decurrens have not done well. Sambur have caused much damage, and in many places the greater number of plants are dead.

Ohiya Plantation.—The 50 acres of the Ohiya plantation are growing well, though 12½ acres had to be entirely re-planted during the year with some 13,000 Eucalyptus robusta. These plants are now growing well, but it is most difficult to keep sambur away. A wire has been placed round the clearing with rattles tied on, but even this has failed to keep them out.

Haputale Plantation.—This plantation continues to be the most successful. During the year seven strips, each containing seven rows of trees, were coppiced, and yielded 497½ cubic yards of firewood.

The annexed statement shows the areas of plantations in the Hill Reserves and receipts and expenditure of the year :—

	Acres.	Receipts. Rs. c.	Expenditure. Rs. c.
Nuwara Eliya	36	... 77 50	... 364 41
Nanu-oya	118	... —	... —
Haputale	59·6	... 1,117 25	... 971 2
Ohiya	50		658 95
Kotagala	14	... —	... —
Galboda	473	... 1,021 61	... 6,865 32
Total ...	714·6	2,216 36	8,859 70

25. **Improvement Fellings:** *Eastern Circle.*—Compartments E, F, M, and N of the Koralai forest, 2,769½ acres in extent, were gone over. Worthless trees suppressing or crowding others to valuable kinds were girdled and in some cases removed, creepers cut, and undergrowth cleared, &c., at a total cost of Rs. 530·03, or about 19 cents per acre.

North-Western Circle.—Creeper cutting was carried out over 31 acres in the Badagamuwa forest in the Kurunegala range at a cost of Rs. 275·48, and similar work over 105 acres in the Attavilla forest in the Puttalam range at a cost of Rs. 131·02.

26. **Communications and Buildings:** (*a*) **Roads.**—Statement No. 5 in the Appendix shows that only the small sum of Rs. 2,923·04 was spent by the whole Department during the year in improving communications.

27. *Western Province.*—Only Rs. 18·54 was spent in improving the approach to the firewood stacking ground at the Mirigama railway station and in repairing washaways.

Central Province.—The Government Agent states: "The greater part of the forest area suffers from lack of communications with markets, particularly the forests in Uda Dumbara."

Northern Circle.—The 9th milepost line (locality not stated) was made into a temporary road for 69 chains, and the Cheenanpiddy road re-cleared at a total cost of Rs. 141.

Eastern Circle.—The road from Mankeni to Nagampamalai, 8·52 miles, was widened, banks sloped, &c., at a cost of Rs. 318·59. A new trace was cut from Kadiraveli to Mavillu, 8 miles, and 1·60

mile of it widened into a cart track for Rs. 91·28. Three other forest roads in the Koralai forest were re-cleared, widened, &c., at a cost, respectively, of Rs. 44·52, Rs. 52·30, and Rs. 8·80.

North-Western Province.—The cart road to Madugolla, in the Kurunegala range, was extended 253 chains, and 485 chains were re-cleared. Twelve new bridges of adzed timber and fifteen temporary bridges of round timber were built and six bridges repaired at a total cost of Rs. 1,193·33. In the Puttalam range the cart road from the 7th mile on the Anuradhapura road to Kalu-oya, 10 ft. wide, was extended 88 chains, and 168 chains were re-cleared for Rs. 97·25. The cart road at the 52nd mile, Chilaw-Puttalam road, 12 ft. wide, was extended 287 chains at a cost of Rs. 90·5. The sum of Rs. 9·95 was also spent in extending another short cart track in the Chilaw range.

North-Eastern Circle.—The money allotted for roads to this Circle was not spent.

Hill Reserves.—A service road, 163 chains in length, was opened in the Moon Plains, and 149 chains of new road were traced through compartments 2 and 3 at Kandapola towards Amherst gap. A road of 60 chains, for the transport of firewood, was also opened at Galboda. The total cost of the three roads was Rs. 769·83.

28. (*b*) **Buildings.**—A considerable sum, viz., Rs. 6,101·94, was spent in repairing officers' quarters and circuit bungalows, but of this Rs. 4,348·23 was spent in the Hill Reserves, the expenditure being very small in the other Circles.

29. *Western Province.*—The sum of Rs. 68·65 was spent in putting into good condition the old resthouse at Matugama, which was taken over from the District Road Committee for the Forest Ranger's quarters at the nominal rent of Rs. 6 per annum.

Province of Sabaragamuwa.—The Forest Ranger's quarters at Gahawattahinna were repaired at a cost of Rs. 67·34.

Northern Circle.—The sum of Rs. 300 was granted in the latter part of the year for building of quarters at Vavuniya for the Assistant Conservator's clerk, but owing to the heavy rains the work was not completed by the 31st December, and only Rs. 176 was spent. The circuit bungalows at Vettakachi, Muruhandi, and Pavaraisankulam were repaired at the total cost of Rs. 375·31.

Eastern Circle.—The Forest Ranger's quarters at Pottuvil, the circuit bungalows at Mankeni and Manmaravadi, and the depôt sheds were repaired at a total cost of Rs. 372·59. The Punanai bungalow, which was built some years ago on a bad site liable to floods, was pulled down, and the good timber stacked with the object of rebuilding the bungalow on a better site in 1903.

North-Western Circle.—A large number of forest buildings were repaired and improved, viz., the quarters of the Forest Ranger and Clerk, three circuit bungalows, a watcher's hut, and some cooly lines in the Kurunegala range; the Forester's office and the outhouses of his quarters at Puttalam; the Forest Ranger's quarters and two circuit bungalows in the Chilaw range; and the Forest Ranger's quarters and one circuit bungalow in the Dambulla range. The total cost was Rs. 929·40.

Eastern Circle.—The sum of Rs. 153·93 was spent in repairing the Forest Ranger's quarters at Horowapotana and the circuit bungalow at Kittuluttu, and in building a new hut for the checking station guards at Kanchimadam.

Hill Reserves.—The large sum of Rs. 4,348·23 was spent in putting into thorough repair the quarters of the Assistant Conservator, of his Head Clerk, and the Forest Ranger at Nuwara Eliya, the quarters of the Forest Rangers at Nanu-oya and Galboda, and the office of the Assistant Conservator.

30. (*c*) **Other Works:** *Eastern Circle.*—Three water holes were cleared and enlarged for the supply of water in the arid Koralai forest at a cost of Rs. 91·91.

North-Western Circle.—A well was dug in the Kankaniyamulla forest, Kurunegala range, for Rs. 55·60. The water supply in two forests in the dry Puttalam range was improved by the excavation of a water hole in one and the construction of a dam in the other at the total cost of Rs. 129·72.

North-Eastern Circle.—The depôt at Trincomalee was fenced in at a cost of Rs. 204, and the well in it cleaned out for Rs. 6·21. The Ranger's quarters at Horowapotana were also fenced at a cost of Rs. 20.

Hill Reserves.—A wire shoot, 1,380 yards long, was put up at Galboda for the bringing out of firewood to the railway, and another shoot of the same length at Ohiya for similar work. The cost is not reported.

CHAPTER IV.

YIELD AND WORKING.

31. Yield.—The under-mentioned timber and forest produce was brought out of the forest by departmental agency and sold during the year. The figures for 1901 are also given for comparison:—

	1901.	1902.
Logs	1,178	2,057
Timber, pieces	14,328	—
Timber, cubic feet	8,745	29,800
Sleepers	—	7
Other sawn timber:—		
Pieces	106	—
Cubic feet	8,298	9,036
Superficial feet	3,891	—
Lineal feet	2,620	145,390
Ebony, tons	541	488
Shingles	—	123,000
Small round timber	43,020	3,983
Warichchies	700	4,958
Firewood, cubic yards	25,351	47,535
Charcoal, tons	10	cwt. 9·3
Charcoal, bushels	482	—
Bamboos and canes	—	17

32. The following timber and forest produce was sold standing in the forest or on payment of royalty during the year. The figures for 1901 are given for comparison :—

	1901.	1902.
Trees, sold per tree	3,098	8,944
Trees, sold per cubic foot	277,834	—
Pieces	211	—
Warichchies (small round timber)	544,547	430,099
Shingles	138,825	77,500
Ebony, tons	184	—
Timber, sold per piece	2	—
Timber, sold per cubic foot	6,097	224,334
Timber, sold per superficial foot	162	—
Firewood, sold per tons	856	1,236
Firewood, cubic yards	118,936	124,976
Charcoal, bushels	950	1,855
Bamboos and canes	186,602	360,032
Other produce	Rs. 4,781·20	Rs. 9,196·58

33. It will be seen from these figures that, with regard to timber brought out of the forest by departmental agency, nearly double as many logs were sold during the year as in the previous year, and more than three times the quantity of timber sold by the cubic foot. In sawn timber there was a falling off in sales by superficial feet, but a very large increase—145,390 against 2,620—in sales by lineal foot. Of ebony, 53 tons less were sold during the year than in 1901. The sale of shingles has revived a little, 123,000 having been disposed of. There was a considerable falling of in sales of small round timber, but a very large increase in the supply of firewood to the Railway Department. Sales of charcoal, bamboos, canes, &c., were insignificant.

34. With reference to sales of timber standing in the forest and of forest produce on payment of royalty, it will be observed that, though the number of trees sold standing was nearly three times as many as in 1901, their total value was less than double, showing that they were of inferior quality, or that lower prices were obtained. Sales of small round timber and of shingles cut and split by license holders show some falling off, while sales of timber by the cubic foot of firewood, both by weight and cubic measurement, and of charcoal all show considerable increase. Sales of bamboos and canes were nearly double those of the previous year. Minor forest produce realized Rs. 9,196, against Rs. 4,781 collected in 1901.

35. The reasons for the increase or decrease referred to above in sales of timber and forest produce in the different Provinces and Circles are explained below.

Western Province.—The revenue for the year was within a few rupees of that of the previous year.

The following timber was supplied departmentally to the Public Departments specified :—

	Rs.	c.
To Government Factory 600 cubic feet hora beams	900	0
To Public Works Department 194 cubic feet planking	484	37
To District Road Committee, Colombo, 2,162 cubic feet planking ...	4,341	87
To District Road Committee, Kalutara, 680 cubic feet planking ...	1,360	0
To District Road Committee, Negombo, 377 cubic feet planking ...	855	95
To Colombo Waterworks 480 cubic feet sundry	559	76
Total ...	8,501	95

The timber, &c., specified below was sold to private persons :—

	Rs.	c.
39,453 cubic feet timber	6,601	49
11 logs	37	55
71,092 mine props and sticks	508	52
48,230 barrel staves	2,824	27
282,800 bamboos and canes	145	72
244 tons firewood	285	52
7,254 cubic yards firewood	2,715	0
1,812 bushels charcoal	452	47
Total ...	13,570	54

The great increase under head "Fuel" is entirely due to the larger quantities of firewood supplied to the Railway. The rapidly increasing demands of this Department are shown by the fact that in 1900 only 8,196 cubic yards of the value of Rs. 1,885·11 were supplied, in 1901 12,571½ cubic yards of the value of Rs. 3,539·71, and in the year under review 35,129 cubic yards of the value of Rs. 9,304·60. The Assistant Conservator states that even larger quantities of wood might have been supplied during the year, but for "want of funds to meet the demands of the fuel contractors" and the continuous bad weather which hampered the work during the last months.

Sales of firewood and charcoal to private persons amounted to Rs. 3,452·99. The Assistant Conservator reports that the demand for fuel for estates is steadily advancing, and he anticipates considerable revenue from this source in future years. The yield per acre of firewood has varied greatly, from 41 cubic yards to 26 cubic yards in different parts of the Province. He adds that these are "low results, and happily not the general experience of all parts of the Province, though the average must be regarded as distinctly poor."

A quantity of firewood was cut for the new Kelani Valley Railway to be delivered during 1903. The Assistant Conservator explains that "the Railway firewood transactions are worked out of a deposit account, and not on the one-twelfth vote system, only the surplus in working being credited to the Department as value of fuel sold. Consequently no credit can be taken for stock till it is consumed." An advance of Rs. 4,000 was obtained from the Treasury to pay contractors, of which Rs. 2,300 was repaid within the year. The value of confiscated and drift timber amounted to Rs. 1,742·80.

Central Province.—Ebony of the value of Rs. 20,785·09 from the Pallegama grant was sold at the Central Timber Depôt, Colombo. The total expenditure of the Government Agent on forest works was Rs. 8,302·79, while the revenue was Rs. 12,393, showing a surplus of Rs. 4,090·21.

Southern Province.—All the information given by the Government Agent is that the surplus revenue from the working of the released areas amounted to Rs. 25,982·80, and that "paper credit" for Rs. 6,322·99 was taken for timber supplied to Public Departments. He expresses the opinion that "we have done extremely well."

Province of Sabaragamuwa.—There was a small decrease in revenue of Rs. 1,798·30 as compared with the previous year. Sales of timber to Public Departments were larger by Rs. 3,416·62, mainly owing to a demand for shingles from the Railway Department. The decline in the supply of timber to private persons amounted to Rs. 6,096·05, and was chiefly due to fewer hora boat planks and barrel staves being wanted, owing to large stocks being in hand. There was a small decrease in firewood supplied to Public Departments owing to the Railway taking more wood in the Western Province, but this was more than compensated for by demands from private persons, chiefly for tea estates. The strict supervision exercised over transport of timber by water has resulted in proceeds of sales of confiscated and drift timber falling to Rs. 157·18, a state of things not to be deplored. A considerable increase of revenue under head "Minor Products," amounting to Rs. 953·75, resulted from the sale of the right to collect latex in the rubber plantations.

Northern Circle.—The only departmental forest work done was the felling of ebony and satinwood for sale at the Central Depôt, Colombo. Only one shipment of 112 logs satinwood was made, owing to difficulties experienced in getting tenders for transport at a reasonable cost.

No timber was felled departmentally to meet local demands. Tenders were called for the sale of the trees stamped in the bed of the proposed Iranaimadu tank, but none were received. An attempt to sell trees standing in the Mandaklaar forest met with the same ill-success, and it has been decided to fell them and bring them out to the sea coast departmentally and then to sell them by auction.

Timber of the value of only Rs. 1,856·21 was supplied to Public Departments, which is Rs. 3,035·26 less than in the previous year. The Assistant Conservator states: "The Public Works Department consider it very troublesome to cut and remove timber from forests for their requirements, and so they have recourse to private parties." Some firewood, quantity not stated, was supplied to the section of the Northern Railway opened, but the Assistant Conservator remarks, "the profit from this transaction is not worth considering."

South-Eastern Circle.—Attempts were made to send timber to the Central Depôt, Colombo, for sale, but no contractor could be found who would undertake the work. Timber of the value of Rs. 249·26 was issued to the Public Works Department, and of the value of Rs. 223·24 was sold to private persons. Small round timber of the value of Rs. 489·55 was also disposed of. The standing stamped trees in five compartments of the Lunugamwihare forest were advertised for sale three times. Only one very low offer was received, which was refused.

Eastern Circle.—The Public Works Department took timber of the value of only Rs. 388·95. The Assistant Conservator states: "The reason given is that teak and other timbers, ready sawn to size, can be got from Colombo cheaper than timber can be obtained locally," but he expresses his doubts as to the fact.

Timber of the value of Rs. 5,186·43 was sold to private persons locally, chiefly at public auction of timber not considered good enough to send to Colombo for sale. The prices realized were not satisfactory.

Standing timber in the Koralai forest to the value of Rs. 10,174 was sold to one man, whose tender was accepted. As he is to pay for the logs as they are shipped, the bulk of the proceeds of the sale will probably be credited to revenue during 1903.

North-Western Circle.—The decrease in the sales of timber in this Circle, as compared with the previous year, was large, viz., Rs. 8,997·32, and was due to the much smaller quantities of ebony and satinwood which were sent for sale to the Central Depôt, Colombo. The Assistant Conservator gives as the reason for this that good contractors with sufficient means are not obtainable in his Circle, and adds: "They are afraid of and do not understand the new rule whereby they must send duplicate tenders to Audit." He also states: "A further reason for fewer sales is that no vessels are now premitted to come to the Northern ports on account of plague. These shipowners used formerly to be large buyers of inferior timber, firewood, &c."

There was an increase of revenue realized by sale of standing timber, due to Rs. 11,000 having been paid by the owner of a saw mill for the hora trees standing in the Dikkele forest.

The Assistant Conservator complains that the Public Works Department continued to purchase imported timbers at much higher rates than those for which Ceylon timber can be purchased.

The making of charcoal for sale in Colombo was discontinued as unremunerative.

North-Eastern Circle.—The bulk of the revenue obtained from the forests was realized by the sale of ebony, satinwood, halmilla, milla, and ranai sent to the Central Timber Depôt, Colombo, which amounted to Rs. 37,949·79. The sum of Rs. 11,774·64 resulted from local sales, as against Rs. 12,562·98 the previous year, showing a decrease of Rs. 788·34. The value of timber supplied to Public Departments was Rs. 3,770·97, which was over three times that of timber supplied during 1901.

Hill Reserves.—The steady decrease of sales of timber, &c., brought out departmentally still continues, as the following figures for the past four years show:—

	Rs. c.		Rs. c.
1899	27,215 70	1901	13,680 36
1900	24,334 14	1902	8,330 37

This is due to the closing of the depôts and the introduction of the system of selling trees as they stand in the forest.

There has been a corresponding steady increase in the revenue realized by the sale of timber standing and of forest produce cut and removed by purchasers on payment of royalty, as the following figures show:—

	Rs. c.		Rs. c.
1899	17,565 32	1901	47,320 73
1900	24,416 91	1902	51,279 28

This increase has been largely due to the great quantities of firewood and small timber supplied to the Boer Camp, Diyatalawa.

A statement (No. 11) of descriptions of trees felled during the year is given in the appendix.

36. **Working.**—The systems of working forests followed in the different Provinces and Circles were the same as in previous years, but as they vary considerably it may be well to give here some account of them.

Western Province and Province of Sabaragamuwa.—In these two Provinces, which are worked separately by one Assistant Conservator, under the orders of the respective Government Agents, the making of as much revenue as possible is the main object. The policy has been to leave the reserved area alone, and to sell the timber and firewood off lands about to be sold. Great quantities of firewood are supplied to the Railway. A very large portion of the Assistant Conservator's time has been occupied in reporting on lands for sale, prosecuting land cases, and regulating the transport of private timber.

Central Province.—The Government Agent is provided with a staff of four Forest Rangers.

Northern Province.—The Government Agent and his Assistants are the only Provincial Revenue Officers who are not provided with forest officers at the expense of the Forest Department to protect Crown lands.

Southern Province.—The peculiarity of the work in this Province is that, though it is heavier and more responsible, and more money is spent and revenue made than in at least two other Circles which are in charge of Assistant Conservators, it is carried on, quite to the satisfaction of the Government Agent in charge, by a Forest Ranger on Rs. 60 per month. Large sums of money have been spent by this officer in demarcating forests. The revenue, amounting to Rs. 41,617 for the year under review, was derived chiefly from the supply of firewood to the Railway and of rough timber and firewood to private persons.

Eastern Province, North-Western Province, North-Central Province, and Province of Uva.—Each of these Provinces is provided with a Forest Ranger paid by the Forest Department.

Northern Circle.—The work consists in felling ebony and satinwood in the remote forests of the Vavuniya District and carting the logs some 60 miles to Elephant Pass for shipment to the Central Depôt, Colombo, for sale. The demands of Public Departments for timber are small, and very little is sold to private persons locally. Attempts to sell timber standing have proved complete failures. Considerable sums of money have been spent in unsystematic demarcation in all parts of the Circle. The working of the forests has resulted in heavy deficits in each of the last four years, aggregating Rs. 13,923.

South-Eastern Circle.—This Circle is temporarily worked by a Forest Ranger, under the orders of the Assistant Government Agent, Hambantota. No timber is sent to the Central Depôt for sale, and only small quantities of jungle posts and sticks are sold locally. A certain amount of work has been done in connection with forest demarcation. The deficits on the working of this Circle for the last four years amount to the large sum of Rs. 29,425.

Eastern Circle.—Large quantities of first class satinwood are sent annually to the Central Depôt, Colombo, and realize good prices. All inferior logs are brought out to the coast and sold by auction, but usually realize little more than cost of felling and transport. This timber is shipped to India for sale. There is very little demand for timber for local consumption. Large numbers of trees have been sold standing at generally satisfactory prices. More systematic demarcation work has been done in this Province than in any other. The annual revenue has always been considerable.

North-Western Circle.—The revenue of this Circle is derived chiefly from sales at the Central Depôt, Colombo. Large quantities of ebony and satinwood are cut and despatched there every year from forests in all parts of the Circle. A large quantity of hora timber was sold standing in 1902. Considerable sums have been spent in demarcating forests. The Railway takes a certain amount of firewood from this Circle, but far less than from the neighbouring Western Province.

North-Eastern Circle.—This Circle, too, depends on sales at the Central Depôt for its revenue. The local auction sales are only of logs not considered worth sending to Colombo. During the last two or three years large quantities of timber have been sold standing in the released areas, the policy being to clear these of all exploitable timber before commencing work in the reserved forests. Demarcation has not been neglected in this Circle, and the work is being systematically done.

Hill Reserves.—The chief sources of revenue have been the supply of firewood to the Railway and to the Boer Camp. Considerable quantities of timber and firewood have also been sold for the supply of Nuwara Eliya town and of a number of estates, but it is doubtful whether the charges for inspection and watching do not rob these transactions of much of the profit. There is a firewood depôt at Talawakele, which has been worked at a fair profit. This Circle is much handicapped by heavy unremunerative expenditure in connection with the plantations at Galboda and elsewhere, and in the upkeep of bungalows and the employment of a large temporary staff.

37. **General Observations.**—The prosperity of the Department depends mainly on sales at the Central Timber Depôt, Colombo, and to keep this supplied with timber forests are ransacked for first class trees even in remote parts of the Island. Little or no attempt is made, except in the Eastern and North-Eastern Circles, to confine fellings to certain forests and to work through them systematically, "taking the lean with the fat" year by year. There are great numbers of trees, the timber of which is sound and durable, but which cannot be sold in the log on account of their small size, but which if sawn up would yield first class building material. The Northern Railway, when completed, will open up forests containing quantities of such second class trees, the timber of which, if sawn up and conveyed at cheap rates to Colombo, would doubtless realize fair prices.

38. **Supply of Timber to Public Departments.**—The following figures, giving the total value of the timber supplied to Public Departments in each of the last five years, show how steadily the indents of the Public Works Department have been diminishing. They are now only one-seventh of what they were in 1898 :—

	Rs.		Rs.
1898	277,316	1901	76,161
1899	197,706	1902	38,877
1900	98,860		

39. The reason for this state of things is not far to seek. One of the first rules of business is that a customer should be supplied with the article he wants in the form he wants it. The Public Works Department can get without delay or trouble seasoned teak and Australian woods, sawn to sizes required, at prices which their estimates can stand. They consequently and naturally object to the inevitable delays attending indents on the Forest Department, resulting often in unseasoned wood, in the log, being supplied, and prefer to pay higher prices for imported sawn timber of which they can get immediate delivery.

40. **Central Timber Depot, Colombo.**—This very important establishment was in charge of Mr. G. T. Gillam, Superintendent, during the year.

41. There was a falling off of Rs. 4,742·31 in sales, as compared with the previous year. The Superintendent reports that he has "no hesitation in stating the cause of this to be the discontinuance of daily sales."

42. The following timber, of the total value of Rs. 124,548·75, was sold during the year :—

Description.	No. of Logs.	Weight.	Cubic Contents.	Amount.	Average.
		Tons cwt. qr. lb.	Cub. ft. in. pts.	Rs. c.	Rs. c.
Ebony	2,106	643 18 1 13	—	62.966 55	97 78 per ton
Satinwood	636	—	16,719 6 9	49,951 20	2 98 per cub. ft.
Halmilla	125	—	1,749 0 '11	2,891 55	1 65 ,,
Ranai	37	—	988 2 7	929 98	0 94 ,,

Hora staves	48,230	—	—	2,824 87	Western Province
			Grand Total ...	124,548 75	

44. It will be seen that the largest sales were on account of the Eastern Circle, amounting to Rs. 46,940·15. The sales of ebony, satinwood, halmilla, &c., from the two divisions of the North-Eastern Circle amounted to the large sum of Rs. 37,949·79. Ebony from the Pallegama grant in the Central Province realized Rs. 20,785·04. The North-Western Circle did not do so well as usual, and sales on account of the Northern Circle amounted to only Rs. 2,877·99. For the first time since the Central Depôt was established timber was sold in it on account of the Western Province, and realized Rs. 2,824·27.

45. Ten auction sales were held at the Central Depôt during the year, when the undermentioned timber was sold :—

Date.	Description.	No. of Logs.	Cubic Contents.	Weight.	Amount.	Total.
1902.			C. ft. in. pts.	Tons. cwt. qr. lb.	Rs. c.	Rs. c.

December 1 ...	Ebony	434	—	155 12 1 12	—	16,536 32
	Total ...	2,679	14,757 6 11	632 15 0 9	—	106,851 46

46. Private sales of timber at the Central Depôt were as follows :—

Description.	Number of Logs.	Cubic Contents. C. ft. in. pts.	Weight. Tons cwt. qr. lb.	Amount. Rs. c.
Ebony ...	38	—	11 3 1 4	695 19
Satinwood	110	3,285 8 1	—	7,320 78
Ranai ...	31	871 9 3	—	871 76
Halmilla	54	735 0 5	—	1,222 27
Palai ...	64	1,928 5 8	—	2,892 70
Ebony pieces	2	—	0 3 1 20	17 13
Jak ...	5	160 2 6	—	144 19
Del ...	4	143 9 1	—	115 0
Railway sleepers	280	—	—	1,540 0
Karumpanichai	27	—	—	54 0
Hora staves	48,230	—	—	2,824 27
Total ...	—	7,124 11 0	11 6 2 24	17,697 29

47. A comparison of the average prices per ton or per cubic foot obtained at the auction sales and by private sale respectively does not bear out the statement of the Superintendent that the falling off of sales at the depôt is due to the discontinuance of the practice of allowing purchasers to select logs at any time at prices arbitrarily fixed by himself. As will be seen, the system of selling, except in exceptional cases, only by auction has resulted in better prices being obtained than by private sale, viz., Rs. 98·37 per ton for ebony, against Rs. 63·20 per ton, &c.

48. The following timber was lying unsold at the Central Depôt at the end of the year:—540 logs (172 tons) of ebony, 141 logs satinwood, 116 logs palai, 18 logs halmilla, and 2 sample pieces.

49. The highest price realized for ebony during the year was Rs. 180 per ton, and for "flowered" satinwood Rs. 17·10 per cubic foot.

50. As regards methods of transport, 1,221 logs were brought by steamer, 521 by native sailing vessels, 456 by railway, and 38 by canal.

51. Expenditure in connection with the Central Depôt amounted to Rs. 3,018·31, which represented mainly the pay of the depôt staff.

52. **Free Grants of Timber.**—The following is a statement of free grants of timber, &c., made during the year by order of Government :—

Provinces.	Timber. Rs. c.	Firewood. Rs. c.	Other Produce. Rs. c.	Total. Rs. c.

Province of Sabaragamuwa ...	27,605	11,598	16,007	—	26,189	12,609	13,580	—
Total, General Administration ...	145,526	65,166	80,360	—	139,648	51,712	87,936	—
Northern Circle	27,955	29,388	—	1,433	9,315	27,597	—	18,282
North-Eastern Circle	60,378	34,488	25,890	—	50,126	31,674	18,452	—
Eastern Circle	41,389	35,252	6,137	—	52,804	30,085	22,719	—
North-Western Circle	53,186	43,662	9,524	—	48,007	37,112	10,895	—
South-Eastern Circle	3,490	9,205	—	5,715	490	11,194	—	10,704
Hill Reserves	61,129	41,899	19,230	—	59,871	48,726	11,145	—
Head Office, including Central Timber Depôt	—	27,672	—	27,672	—	30,491	—	30,491
Total, Provincial Administration...	247,527	221,566	60,781	34,820	220,613	216,879	63,211	59,477
Grand Total	393,053	286,732	141,141	34,820	360,261	268,591	151,147	59,477
Nett	—	—	106,321	—	—	—	91,670	—

55. It will be seen from this that, as usual, the Northern Circle and the South-Eastern Circle show deficits of Rs. 18,282 and Rs. 10,704 respectively. This is the fourth year in succession in which the expenditure in these Circles has largely exceeded the revenue. The largest surplus, viz., Rs. 32,306, was made by the Southern Province, the forests of which are worked by a Forest Ranger on Rs. 60 per month, under the orders of the Government Agent. The next largest surplus was that of the Eastern Circle, viz., Rs. 22,719.

56. The following statement shows the financial result of the operations of the Forest Department during the year, estimated in the way followed in previous years :—

		Rs. c.
Revenue.		
Cash credited in the Treasury		343,833 28
Value of timber, &c., sold to Public Departments and credit taken ...		16,427 10
		360,260 38
Value of free grants of timber		12,319 24
Estimated value of timber on lands sold		38,466 25
	Total ...	411,045 87
Expenditure.		
Disbursed by the Department		268,593 99
	Surplus ...	142,451 88

57. The financial condition of the Department at the end of the year, taking everything into consideration, is represented by the following statement :—

In favour of the Department.	Rs. c.	*Against the Department.*	Rs. c.
Surplus	142,451 88	Outstandings due by the Department at the close of the year ...	597 45
Outstandings due to the Department at the close of the year... ...	3,460 16	Outstandings due to the Department at the beginning of the year ...	8,053 7
Outstandings due by the Department at the beginning of the year ...	1,152 28		
Total	147,064 32	Total ...	8,650 52

Nett amount in favour of the Department, Rs. 138,413·80.

CHAPTER VI.

GENERAL REMARKS.

58. Mr. F. Lewis, Assistant Conservator, Province of Sabaragamuwa, reports: "By special orders of Government I was seconded during the year to assist the Government Gold Expert, Mr. George E. Dixon, in his exploration for the precious metal over a large part of Ceylon. I was so engaged for fifty days, the line of country explored being from Avisawella, round the base of the Adam's Peak country, and through the foot of the Dolosbage hills, and from there through Kadugannawa, Peradeniya to Matale, and as far as Sigiriya, re-crossing the line at Dambulla and on to Kurunegala and westward to Wariyapola, while including separate offsets into Rattota and Galagedara."

59. Mr. Lewis's "Descriptive Catalogue of the more useful Trees and Flowering Plants of the Western and Sabaragamuwa Provinces" was published during the year, and copies sent to the different Government Establishments.

60. A large game sanctuary was proposed to be proclaimed in the northern part of the Puttalam District during the year, and Mr. H. R. Spence, Assistant Conservator, was gazetted Forest Setttlement Officer, but his appointment was afterwards cancelled and the Government Agent appointed instead.

61. The health of the officers of the Department was on the whole good during the year, except in the Northern and North-Eastern Circles, where fever prevailed. Some of the employés in the Hill Reserves suffered a good deal from influenza.

62. The circumstances under which the duty of compiling this report devolved upon me are as follows. After acting as Conservator of Forests for nearly eighteen months, from 31st January, 1901, to 15th June, 1902, I was compelled by serious ill-health and an affection of the eyes to take leave of absence and go to England. During the time I was acting as Head of the Department I wrote the Administration Reports for 1900 and 1901. On my return to the Island on the 20th April last I was ordered by Government to compile the report for 1902.

ALFRED CLARK,
Assistant Conservator of Forests.

Colombo, May 21, 1903.

ROYAL BOTANIC GARDENS.

REPORT OF THE ACTING DIRECTOR FOR 1902.

CONTENTS.

1.—Scope of Department.
2.—Extensions.
3.—Notes on Economic Products.
4.—Laboratory and other Scientific Work.
5.—Museum, Herbarium, and Library.
6.—Publications.
7.—Dispersal of Seed Experiment.
8.—Plants for Drifting Sand.
9.—Introduction of "Male" Bamboo.
10.—Notabilia Board.
11.—Photography.
12.—Vitality of Seeds.
13.—Retirement of Draughtsman.
14.—Changes and Movements of Staff.

Supplements.

1.—Government Mycologist's Report.
2.—Government Entomologist's Report.
3.—Report of Controller. Experiment Station.
4.—Government Chemist's Report.
5.—Scientific Assistant's Report.
6.—Report of Curator, Peradeniya Gardens.
7.—Report of Superintendent, Hakgala Garden.
8.—Reports of other Branch Gardens—
Nuwara Eliya.
Henaratgoda.
Anuradhapura.
Badulla.
9.—Receipts and Expenditure.

1.—SCOPE OF THE DEPARTMENT.

THE Department continues to expand. The functions and activities may be classed as follows:—

The botanical survey of the Island.
The study of various physiological and pathological botanical questions in relation to the economic plants of the Island.
Experimental agriculture.
Experimental horticulture.
The demonstration and encouragement of horticulture at various elevations.
The distribution of seeds and plants that are not to be obtained from local seedsmen.
The giving of advice and information on botanical, agricultural, and horticultural matters,
The care of the health of the crops of the Island.
The introduction and trial of new plants suitable for economic cultivation.

It is not possible in the limits of this publication to give an adequate description of the work done in any of these departments. This can be found in the separate and more detailed reports of their several branches issued by the Mycologist and Assistant Director, the Entomologist, the Chemist, and the Controller, Experiment Station, respectively, and in the Circulars and Journal of Agriculture published at frequent intervals by the Department.

The work of giving advice to planters and others in Ceylon is added to by a very large foreign correspondence. During the past year many requests for advice and information have come from the new Colonies of South Africa and from India and the Straits and other places.

A constant correspondence is kept with all the British and most of the foreign botanical, horticultural, and agricultural stations, and information is frequently asked and given.

The total number of letters dealt with inwards during 1902 was about 6,850 and of book packets about 1,600, and similar numbers outwards, showing an increase on previous years.

In addition to dealing with the steadily increasing routine work of the Department, the Head Clerk, Mr. R. H. Pereira, has begun the systematic arrangement and cataloguing of a large mass of old official correspondence. This, when finished, will make all the records, on a great variety of subjects, at once available whenever wanted.

2.—EXTENSIONS.

During the year 1902 several changes have been made, which will lead to an increased usefulness from both a scientific and economic point of view.

The most important step forward has been the addition to the Department of an Agricultural Experiment Station. Gangaroowa estate, which occupies the other side of the Mahaweli-ganga river,

which runs round the Peradeniya Gardens, has been purchased by the Government for this purpose. It consists of some 500 acres of land, comprising 300 acres jungle on the slopes of a hill 500 ft. high and 200 acres flat alluvial land. The annual rainfall, like that recorded in the Gardens, averages 90 inches. The land has been cultivated for some eighty years, and was the earliest estate to be opened in coffee, having been opened by Sir Edward Barnes, K.C.B., Governor of Ceylon, early in 1825.

The need for such an experiment station has long been felt, and the site chosen gives every promise of this, the first British Tropical Agricultural Experiment Station on any scale, being of the greatest value to Ceylon in the first instance, and in some measure to the whole Empire. The fact that the station adjoins the Royal Botanic Gardens will enable the Director and his colleagues effectually to superintend the various experiments carried on without loss of time, while the climate and elevation of the place will make the results of general value, as it represents a very large proportion of the cultivated land in the Island.

The object of the station is to add to our knowledge of economic products by using scientific methods in experiment and observation. Such questions as the best methods of cultivation of plants already being cultivated for profit with a view to improving these; the prevention and cure of the diseases associated with cultivated plants; the introduction of new and untried plants of possible economic value; the improvement by selection and other scientific methods, of economic plants; the determination of the value of various manures for different crops; the value of shade for each product; and the best trees and number of them to be used;—these and many other points of vital importance to agriculture in Ceylon and the Tropics generally will be experimented on and the knowledge gained published.

The Government appointed Mr. Herbert Wright, A.R.C.S., at that time Scientific Assistant in the Department and Acting Curator of the Peradeniya Gardens, as Controller of the station. Mr. Wright, by his scientific training and attainments, is specially fitted for this appointment, and has taken up the various duties of the post with energy, and with already a great measure of success.

The condition of the estate was a dense and almost jungle-like collection of timber trees, cocoanut and arecanut palms, with cacao, planted in many places as closely as 5 feet apart, growing underneath, and therefore in every respect most favourable to the attacks of the cacao canker fungus. Though in 1898 the estate, which was examined by the writer, had only 10 per cent. of trees so attacked, the favourable condition of damp and absence of sunlight enabled the disease to spread very rapidly, so that when Government acquired the estate no less than 96 per cent. of the trees were seriously diseased. It was thus necessary first to grapple with the cacao disease, and the experiment, which was at once commenced, of freeing the estate from the fungus will no doubt in a year or two prove conclusively that it is possible, even in the case of an estate riddled with disease, to eradicate the canker and keep the trees free from it in future. If this, the first experiment of the station, proves to all Ceylon cacao-growers the certainty of cure if measures are vigorously carried out—a by no means unanimously accepted belief—the station will from its beginning have been of great value to planting.

The report of the Controller, published separately, contains information as to the present condition of the cacao and details of measures adopted, and it is therefore not necessary here to say more than that the disease is already distinctly decreased, and the crop has improved more than 20 per cent.

In order that the best technical advice and help might be at the disposal of the Government in the carrying on of the work of the Experiment Station, His Excellency the Governor appointed a Committee consisting of the Director of the Gardens (President); the Hon. the Government Agent, Central Province; Mr. M. K. Bamber, Government Chemist; the Hon. Mr. J. N. Campbell; Mr. J. B. Carruthers, Government Mycologist and Assistant Director; Mr. E. E. Green, Government Entomologist; Mr. Joseph Fraser; the Hon. Mr. S. N. W. Hulugalle; Mr. T. C. Huxley; the Hon. Mr. E. Rosling, Planting Member of Legislative Council; Mr. E. Turner; and Mr. H. Wright. The Committee meets every two months to discuss the multifarious directions in which good work can be done, and to select the most important of these and devise the best methods of carrying them out.

Since the opening of the station the agricultural experiment plots existing in the Gardens have been no further extended, and some of the plants have been transferred to the Experiment Station. The Royal Botanic Gardens will in future deal with horticultural plants alone, leaving the trial and experiment of agricultural plants for the Experiment Station.

Another expansion has taken place in the opening up of a small experimental garden of about 5 acres at Nuwara Eliya. The climate of Nuwara Eliya differs from that of Hakgala, and many plants which prosper at the lower elevation will not grow vigorously at Nuwara Eliya. Mr. Nock has already transformed a piece of land containing patana plants into a most promising garden, which is an ornament to Nuwara Eliya and contains experimental plots of much interest.

3.—Notes on Economic Products.

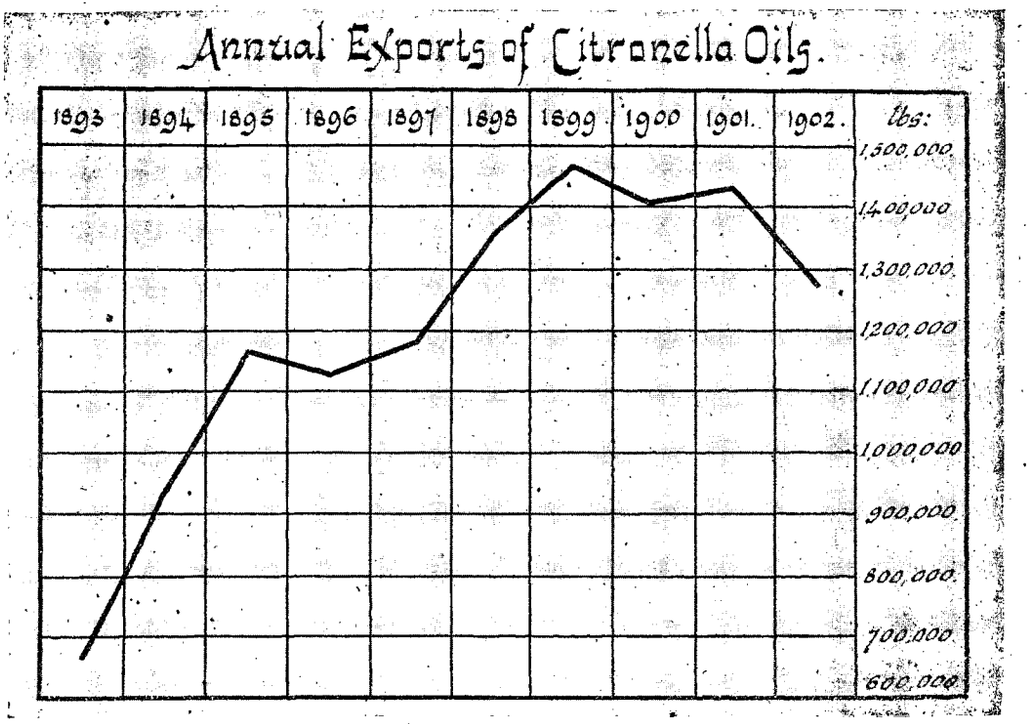
Para Rubber is rapidly taking its place as one of the most important of the cultivations of the Island, and has been planted up in various climates at different elevations, but will be found no doubt most profitable at the lower elevations. During the year some 250,000 seeds have been distributed from the trees in the Henaratgoda Garden. Good yields have been obtained, and the best methods of getting rid of the water and preparing the "biscuits" for the market are beginning to be understood and practised. Prices have kept up to a high figure, over 4*s.* having been obtained for a large quantity. It is important that the Ceylon name in the London market as the best quality of this rubber should be maintained, and no carelessly prepared or inferior rubber exported. This cultivation is most promising in Ceylon, and both from the point of view of the production and the probable future market prices, if present methods and standards are continued, should be one of the most valuable of the Island's crops. No diseases have to be recorded of this plant. Some injuries by animals, pigs, &c., occasionally occur, but these are not difficult to deal with and need not cause alarm.

Some small areas of *Castilloa Rubber* planted at about 1,500 feet and trees twenty-four months old showed a vigorous growth, a series of measurements which the writer made giving an average height of 14 feet 9 inches, average girth at 1 foot from ground 15¼ inches, at 4 feet 13¼ inches. The amount of latex in the tissues of these young trees was also encouraging.

An experiment has been planned, and will be carried out during the present year, with the growth of Para Rubber on irrigated land in the dry-zone region of the Island. The results of this will not be available until the trees are sufficiently old to have the latex taken from them, but the condition of the plots will be noted and recorded.

Camphor continues to be planted up in various up-country districts. At the present time the supply is not equal to the demand, and the price, which some few years ago was 50*s.* per cwt., is now often over £10. The market would be able to stand an increased production, though this would tend to lower prices, but with a lower price there would arise a greater demand as at present. Camphor is too costly, except when it is essential in some manufactures, such as smokeless powder. The present supply from Formosa is likely to decrease, as the trees are being cut down to obtain the camphor and not planted in equal quantities. For a supplementary cultivation the growing of camphor for leaf plucking is to be recommended.

The *Citronella* industry is still in a depressed condition, and showed a falling off of about 15 per cent. The continual adulteration of this oil with kerosine and other cheap oils, which are difficult to detect, has lowered the value of this oil, and the price, about 9*d.* per pound, does not make this cultivation sufficiently remunerative. Until by means of putting sound oil on the market a clean name is obtained for the Ceylon article, it cannot be hoped that the best prices, often 1*s.* 3*d.*, can be obtained. There is a large demand for this oil, if pure, but there are various substitutes which can be employed if the article falls below a certain standard.

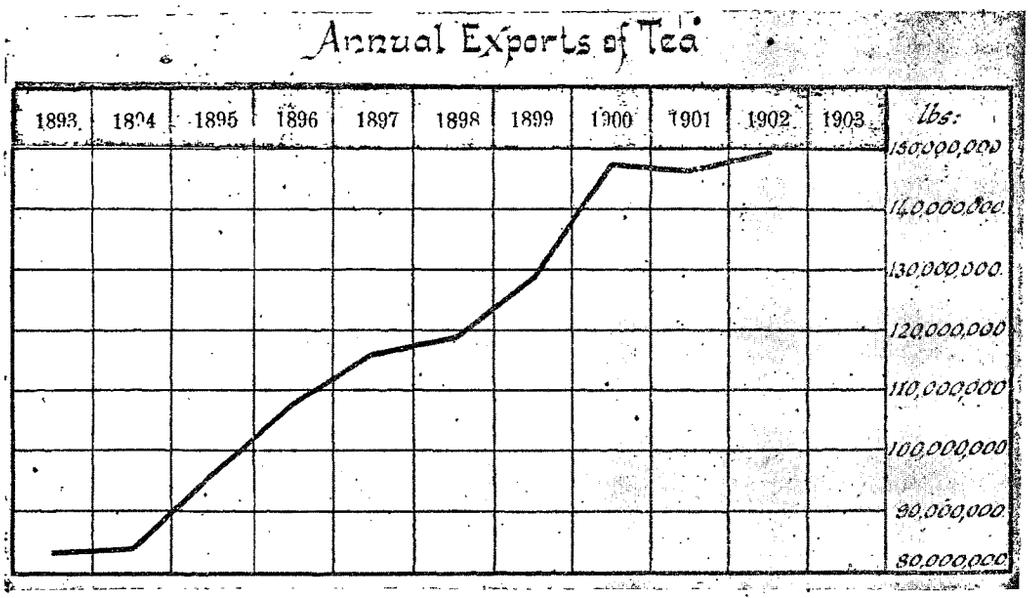


Cocoanuts are receiving more attention from planters, both European and native, and the cultivation of this useful palm has generally improved. The exports of cocoanut oil and poonac have increased, of copra a little decreased, and the cocoanuts exported whole is also less than 1901. The prices of all the various marketable produce of the cocoanut palm have been maintained. Advice has been given as to the value of *Mimosa pudica*, the sensitive plant, as a nitrogenous manure dug in; the roots of this plant usually contain a high proportion of the nodules caused by bacteria which produce nitrogen, and experiments with this plant are so far most encouraging. The area under cocoanut cultivation has been considerably increased, and a considerable selection of seed nuts is being practised in many cases.

The export of *Cinchona* bark has fallen considerably. Some small areas have been planted. The prices for cinchona have not been encouraging. Until some efforts are made to improve the quality of cinchona planted by grafting and selection, as has been so successfully done in Java, this industry will not be sufficiently remunerative to attract planters.

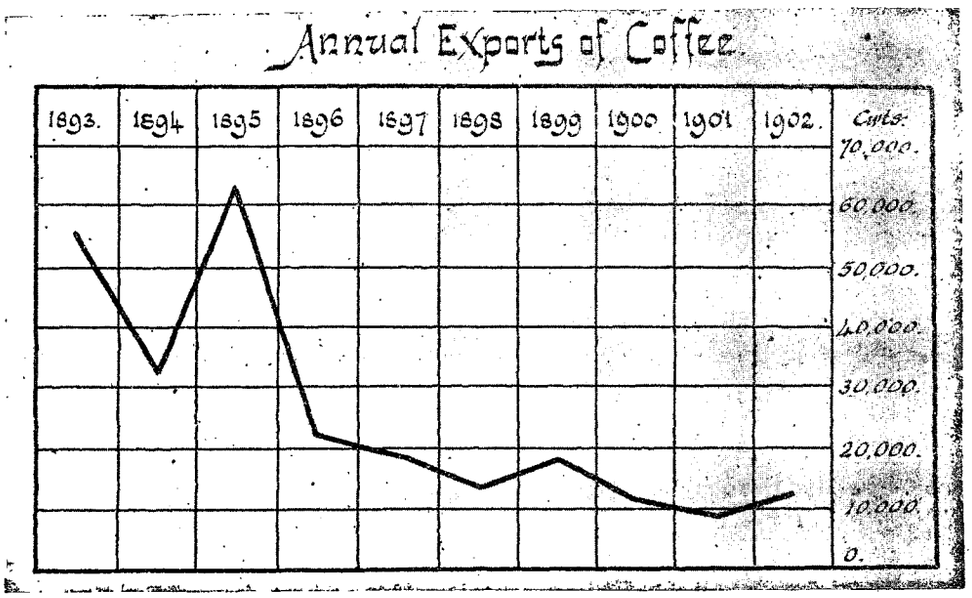
The production of *Tea* all over the Island has increased slightly, and the proportion of green tea has more than doubled, some 4,000,000 lb. having been made. The prices have been slightly lower, 6⅞*d.* being the average price, against 7*d.* in 1901; but this is not due to any falling off in the quality of the tea produced, but to the condition of the home market, which was rather over-burdened with stocks. Though the weather, especially during the latter part of the year, has been most unfavourable for both the health of the tea bush and the production of leaf, tea estates have not suffered to any special degree from diseases. "Gray Blight" has been active in various parts, but not so much as seemed probable from the climatic conditions. More cases of root disease have been recorded, but this is no doubt due to the fact that planters now recognize the cause of the death of the bushes, and not that this evil is on the increase. Very little, if any, tea has been planted, and the prospects of the industry seem generally hopeful.

"Shot-hole Borer" and Helopeltis and later in the year the Lobster Moth did some damage, but the advice of the Government Entomologist was sought, and means have been taken to combat all of these pests.



Coffee production remains about the same, the slight increase being due to a rather better yield than usual. The leaf disease shows no sign of abating, and will not do so while there is all over the Island sufficient coffee for it to continue an active existence. The only hope of being able to again grow coffee with remunerative profits lies in an extinction of all the coffee plants in the Island, an almost impossible and unpracticable event.

The table below of the last ten years' production does not show the descent from the exports of the prosperous days of coffee some thirty years ago, when more than 1,000,000 cwt. were produced and exported, or a hundred times the present output.

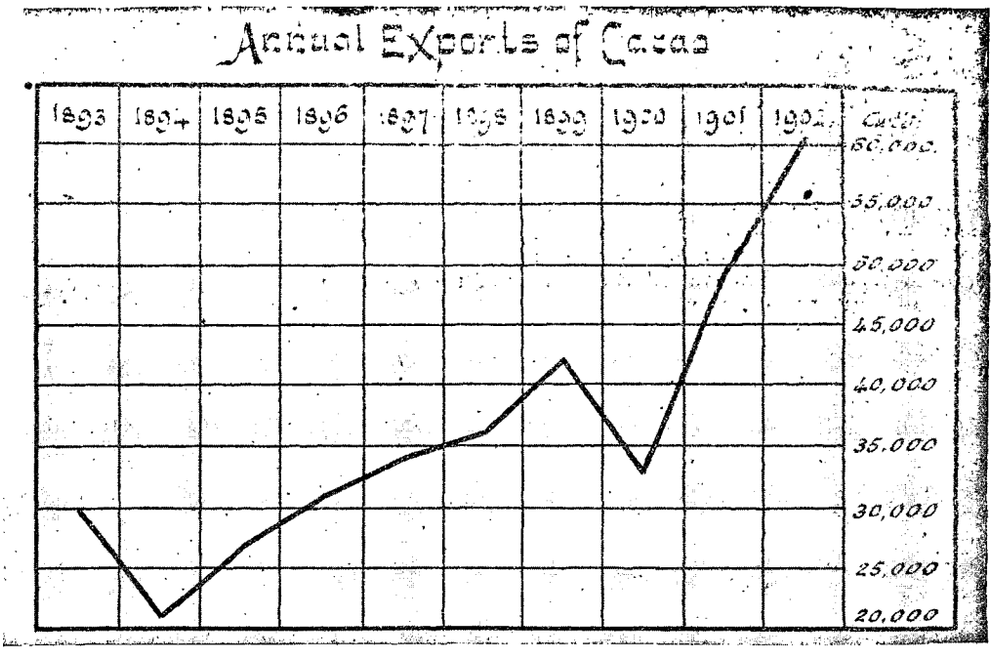


The condition of *Cacao* in the Island is prosperous, but not without an element of danger. The crops have been plentiful, and show an increased production of nearly 20 per cent. Not much of this is due to new cacao coming into bearing; it is chiefly owing to improved crops on the majority of estates. The abnormal rainfall in the cacao districts (about 25 per cent. above the average) has been in favour of the spread of the canker fungus, and on many estates the position in regard to freedom from canker is very little, if any, better than last year. The estates where the remedial and preventive work has been carried out energetically are rapidly being freed from the disease, but these estates are only a small minority. The largeness of the crop has in many places prevented the crusade against canker being carried on effectively, as the amount of labour available for this work was less, extra labour being needed to get in the crop. The cost of curing was also increased by the absence of sunny weather, during which the cacao can be dried in the open at less cost and with better results than in the drying-house.

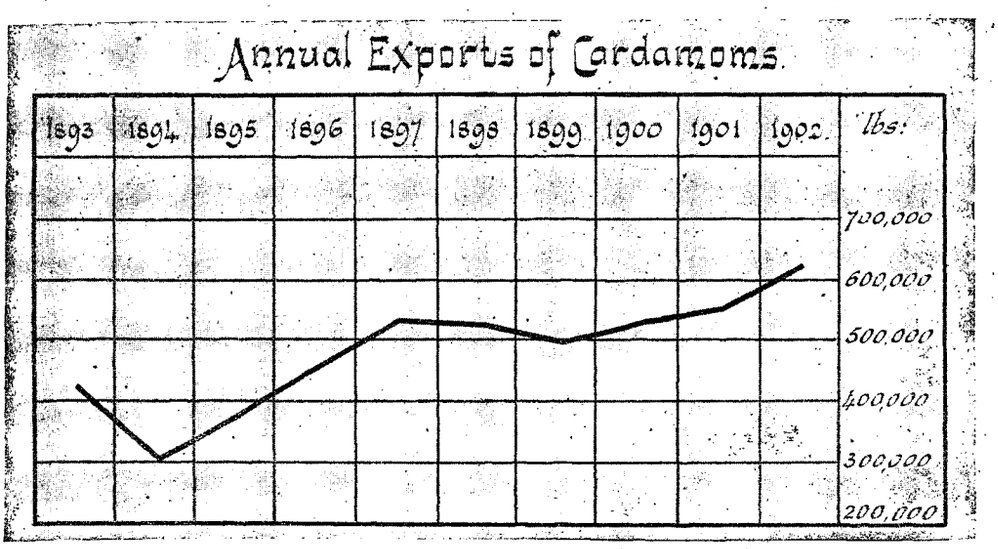
A note of warning is needed that no planters get a false sense of security owing to the reduction to some extent of the ravages of the canker. The disease is still a menace to the profitable cultivation of cacao, and should be seriously and unitedly dealt with. A considerable sum of money spent in effectually ridding an estate of the disease as soon as possible is a better investment than a half-hearted battle, and probably unsuccessful, spread over a long series of years.

The prices of cacao have not been encouraging; this is due to the fact that the old Ceylon red cacao bean with a brown break and a bright external colour is now not easy to get pure. A series of observations in different estates show that even in fields of isolated red cacao 40 to 50 per cent. of the pods contain seeds of the "Forastero," or purple bean variety, in varying proportions from only one or two purple seeds in a pod to 50 per cent. or more.

More attention to the selection of heavy bearing trees—*i.e.*, trees that year after year crop heavily—and keeping estates in a healthy condition are the most important directions in which progress can be made in the profitable cultivation of this valuable product.



There are now more than 8,000 acres of *Cardamoms* under cultivation in Ceylon. The quantity produced has increased during 1902 by about 10 per cent., owing in a great measure to the abundant rainfall in all the cardamom districts. The prices do not improve. The most hopeful direction for progress with this product is in discovering the conditions which favour the fertilization of the flowers and so inducing an increase of fruit. No serious disease has affected cardamom plants, though a careful watch should be kept for any fungous or bacterial disease, as the conditions of shade and moisture under which cardamoms flourish are favourable to such enemies.



The production of *Pepper* has been about the same as 1901. The crop has been slightly above the average. No disease has been recorded which has done serious damage. The pepper in South India has been suffering from a parasitic disease, the nature of which has not yet been discovered, and it is therefore most important that any disease of pepper plants in Ceylon should at once be brought to the notice of the Government Mycologist. The cultivation of pepper in Ceylon is only as a subsidiary product on cacao and other estates, and it is consequently not of very high quality, and no special efforts have been made to improve it.

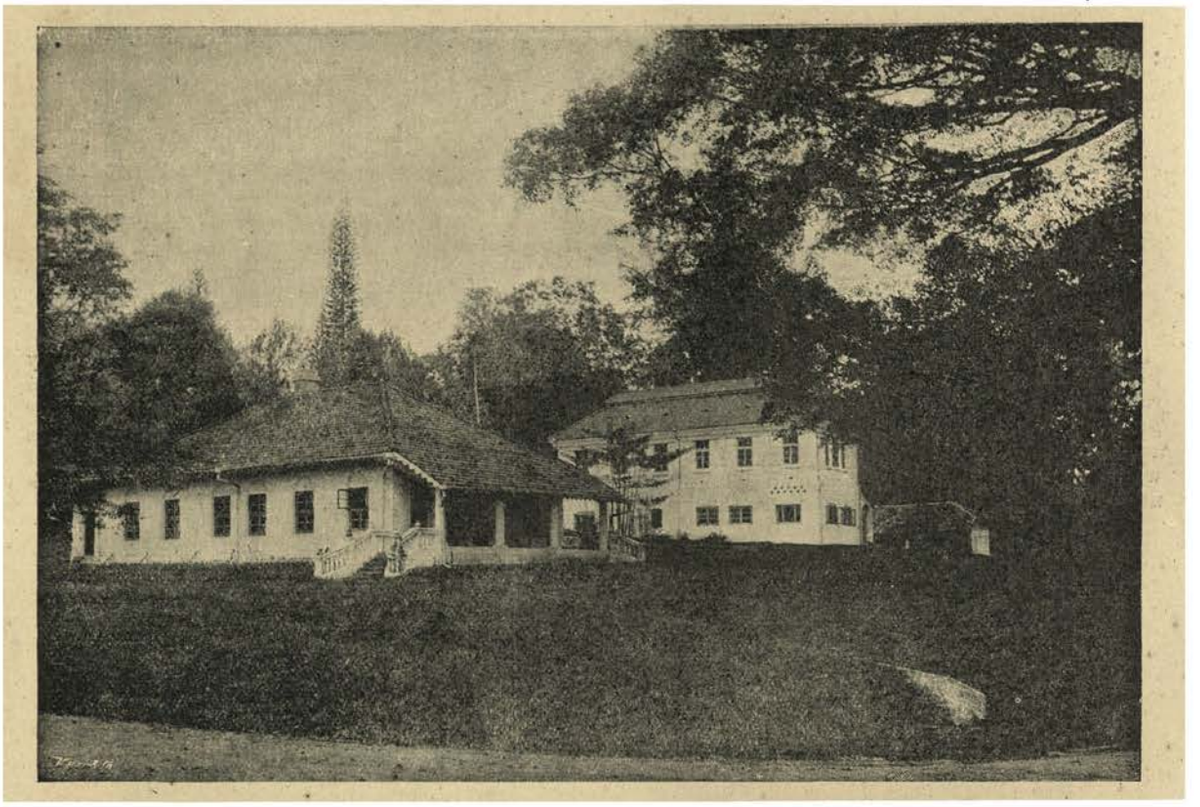
Vanilla planting has been but little extended, and the quantity and quality of the pods have not improved. The visit of Mr. Dupont, Curator of the Botanic Station, Seychelles, to Ceylon has enabled us to get information about methods and cultivation which should help in this industry, a most profitable and suitable cultivation for small holders who can give their personal attention. No serious disease has attacked the vanilla plants, but in many places the plants have not flowered, or flowered very sparsely. A series of picked plants will be obtained during this year from Seychelles for experiment and observation.

4.—LABORATORY AND OTHER SCIENTIFIC WORK.

The research work of the various members of the staff is recorded in the reports appended.

The Laboratory has been used by the following visitors during the year:—Dr. Uzel of Konniggratz, who, in addition to collecting and investigating the Thysanuridæ or Thrips, a group of

animals on which he is the authority, and which are of economic importance because they are the cause of much damage to many cultivated plants, made a series of observations on the birds and insects of the Peradeniya district; Dr. Svedelius of Berlin, who is working at the Algæ of the Island, worked for a short time in the Laboratory and afterwards at the Galle Marine Laboratory conducted by Mr. Hornell; Mr. Dupont, the Government Botanist of the Seychelles, paid a visit of some months to Ceylon, and in addition to working in the Gardens and Laboratory visited, with the Acting Director when on tour, several typical estates and studied the methods of cultivation of cacao, cocoanuts, cardamoms, pepper, rubber, and other products; he also took away from the Island many useful and ornamental horticultural plants to introduce into the Botanic Gardens of the Seychelles; Mr. W. J. Johnson, Curator of Gardens, the Gold Coast Colony, also spent some time in the Island studying the Gardens and the general agriculture and horticulture of the Island, and was provided with seeds and plants; Miss Emilia Noel, who had been on a botanical expedition in the Kashmir; M. Ravul Masselin, Inspector of Forests in Cochin China; Dr. Arthur Richardson, Professor of Chemistry, Allahabad; Dr. J. Brunchorst, Director of the Bergen Museum, Norway; Dr. Jonathan Hutchinson, F.R.S.; Mr. Henry Oldendorf; Miss Croker; and others; while several residents in the Island, foresters, planters, and others availed themselves of the opportunities presented by the Herbarium, Library, and Laboratory for study.



LABORATORIES, HERBARIUM, AND LIBRARY.

The resthouse built by Government for the convenience of scientific visitors working at Peradeniya, situated immediately outside the gates of the Gardens on the high road to Kandy, was opened early in the year, and has proved of the greatest value to workers. Two rooms are reserved for the special use of naturalists working here. It is most commodious, and managed in a manner which conduces to the comfort of those making a stay at Peradeniya.

Of botanical work done by workers outside the Department, the most important is the publishing of a book by Mr. F. Lewis, Assistant Conservator of Forests, which contains a list of the plants he has observed during his Forestry work, and will be of use as a smaller and less expensive volume than Trimen's Flora.

Mr. J. F. Jowitt of Bandarawela, who has a critical knowledge of the group, has been working at the grasses of Ceylon, chiefly those in his own district.

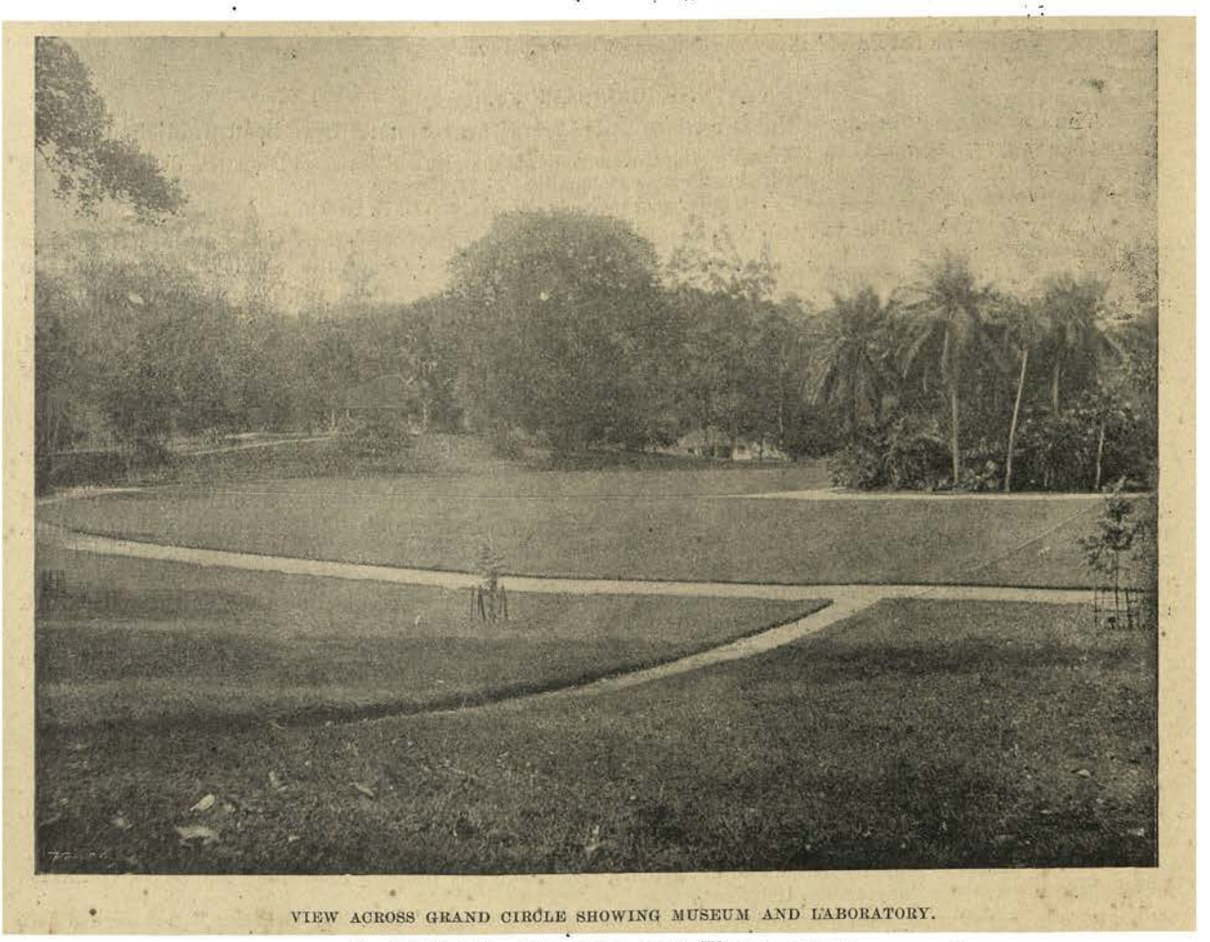
The following interesting list of the time of flowering of orchids in the Balangoda district was received from Mr. A. N. Paine :—

Name.	Time of Flowering.
Oberonia Syllæ, Lindl.	December, January, February
Microstylis discolor, Lindl.	August, &c.
Liparis nervosa (?)	July
L. obscura	October
L. disticha	July
Dendrobium Macræi, Lindl.	August, September
D. nutans, Lindl.	July, September
D. macrostachyum, Lindl.	Any time
D. Maccarthiæ, Thw. (Pelmadulla)	April, May
D. heterocarpum	December, &c.
Bulbophyllum petiolare, Thw.	August
B. elegans, Gardn.	February
Cirrhopetalum Wightii, Rchb. f.	July, August
C. Macræi, Lindl.	Any time
Pholidota imbricata, Lindl.	July
Eria bicolor, Lindl.	September, October
E. tricolor, Thw.	October, November

Name.	Time of Flowering.
E. Lindleyi, Thw. ...	August, September
Phajus luridus, Thw. ...	August, September
Calanthe veratrifolia, Br.	March, August, September
Eulophia nuda ...	September, October, December
E. macrostachya, Lindl.	September, December
Cymbidium bicolor, Lindl.	February, March
C. ensifolium, Sw. ...	August
Josephia lanceolata, Wight	October
Polystachya zeylanica ...	May, August
Sarcochilus pulchellus, Thw.	June
Vanda parviflora, Wight	Any time
V. spathulata, Spreng.	December, January
Saccolabium filiforme, Lindl.	September, October
S. gracile, Lindl. ...	January
S. brevifolium, Lindl. ...	February
S. acaule ...	October
Cleisostoma tenerum ...	December
Cottonia macrostachya, Wight	February, March
Podochilus falcatus var. *angustatus*, Thw.	October
Octarrhena parvula ...	October
Cryptostylis arachnites, Bl.	October, &c.
Hetæria Gardneri ...	February
Cheirostylis parvifolia, Lindl.	February
Physurus Blumei, Lindl.	September, October
Anœctochilus regalis ...	May
Spiranthes australis, Lindl.	Any time
Habenaria breviloba, Thw.	August, September, October
Mystacidium zeylanicum (?), Lindl.	September

It is pleasant to be able to record lay help in the botanical survey of the Island, and any workers may be assured that the officials of the Department will be glad in any way they can to be of use to such workers in botany.

It is fitting in this annual report to record the untimely death of a planter, Mr. Oliver Collett, F.R.M.S., of Bin-oya, Ambagamuwa, who, in addition to much original work with the land shells of Ceylon, was a great help to the Department by his careful observations of the life-histories of various parasitic fungi and insects attacking tea. The loss of his useful information, always cordially given, was keenly felt by all the scientific officers of the Department.



VIEW ACROSS GRAND CIRCLE SHOWING MUSEUM AND LABORATORY.

5.—MUSEUM, LIBRARY, AND HERBARIUM.

The Museum has been added to and to some extent re-arranged. A new case for economic exhibits designed by Mr. Willis has been erected in the south room. An interesting exhibition case illustrating the lac industry, mentioned in the Government Entomologist's report, was arranged by him. An exhibition of timbers has been arranged by Mr. Herbert Wright. This consists of a complete series of Ceylon *Diospyros* (ebonies, calamander, &c.), a group at which Mr. Wright has been working out the distribution, anatomy, and physiology. The specimens show the sections of the various beautiful timbers of this family and the position the dark wood takes in the stem of the trees. Several of the specimens exhibited were previously unknown in Ceylon.

Some transverse sections have been made of trees of known ages to show the annular rings. This question of the period taken in the production of these rings, which correspond to the annual rings of temperate climates, is of great interest, and all specimens of trees of known age which can be sent—a thin transverse section near from the ground being all that is necessary—will be much welcomed.

The chief additions to the Herbarium have been a collection of Ceylon plants made by the late Mr. George Wall and a presentation collection from Professor E. Rosenstock.

The Draughtsman has made a number of coloured drawings of botanical subjects during the year, including a series of the varieties of *Hibiscus* growing in the Gardens.

A large number of important books and pamphlets, more than 150 in all, have been added to the Library, both by presentation and purchase, of which the following are to be noted :—

Saccardo, P. A., Sylloge fungorum omnium hujus re cognitorum. Vols. I.–XVI.
Deane, H., and Maiden, J. H., Further Notes on supposed Hybridization amongst Eucalypts, &c.
Deane, H., and Maiden, J. H., Observations on the Eucalypta of New South Wales.
Crombie, J. M., A Monograph of Lichens found in Britain.
Lister, A., A Monograph of the Mycetozoa.
Banks, Sir J., and Solander, D., Illustrations of the Botany of Captain Cook's Voyage round the World.
Gardiner, J. S., The Formation of the Maldives.
Chamberlain, C J , Methods in Plant Histology.
Svedelius N., Z. Kenntniss d. saprophytischen Gentianaceen.
Lang, W. H., On the Prothal i of Ophioglossum pendulum and Helminthostachys zeylanica.
Mills, J. W., Citrus Fruit Culture.
Uzel, H., Monographie der Orunung Thysanoptera.
Johnson, H., Fumigation Methods.
Chamberlain, C., Methods of Plant Histology.

The following new periodicals have been added to those regularly received :—

Agricultural Magazine, Colombo.
Agricultural News : Barbados
Annuario del R. Ist. Botanico di Roma.
Berichte d. Schweiz. Bot. Ges.
Berichte uber Land-und Forstwirtschaft in Deutsch Ost Afrik
Boletin do Musen Paraense.
Boletin Mensual, Observatorio de Manila.
Bulletin, Ohio Agricultural Experiment Station.
Madagascar : Notes, Reconnaisances, et Explorations.
Nyt Magazin for Naturvi lenskaburne.
Recueil de l'Inst. Bot., Univ. de Bruxelles.
Report of Agricultural Work, Barbados.
Verslag van het Proofstation voor Suikerriet in West Java.

6.—PUBLICATIONS.

The following numbers of the Circulars and Agricultural Journal have been published :—

Vol. II., No. 1.—Annual Report of the Government Mycologist and Assistant Director. J. B. Carruthers
Vol. II., No. 2.—Further Observations on Helopeltis. E. E. Green.
Vol. II., No. 3.—The Tea Tortrix (*Cupua coffearia*, Nietner). E. E. Green.

A new feature, which will no doubt add greatly to the usefulness of these publications, has been the introduction of illustrations. In the last Circular Mr. Green drew and lithographed the illustration. It is hoped, now that the methods of reproducing photographs are so efficient and cheap, to use illustrations frequently in making clearer the matter contained in these Journals.

Two numbers, Parts III and IV. of Volume I. of the scientific journal established in 1901 entitled "Annals of the Royal Botanic Gardens, Peradeniya," for the publication of research work done in the Laboratory and Gardens, were published during the year, and contained—

A Revision of the Podostemaceæ of Ceylon. J. C. Willis.
A Handbook of the Economic Products of Ceylon (Gums and Resins). J. C. Willis and Herbert Wright.
Studies in the Morphology and Ecology of the Podostemaceæ of Ceylon and India. J. C. Willis.

This last, a most important work of 200 pages, consists of a record of research in this interesting group of plants, upon which Mr. Willis is an authority, and to which he has devoted much time. It is illustrated by a series of more than thirty plates, photographs, and lithographs, which are exceptionally beautiful and careful drawings.

Amongst others, the following papers have been published during the year dealing with work done at Peradeniya by members of the staff and others :—

J. C. Willis, On the Dorsiventrality of the Podostemaceæ, with reference to Current Views on Evolution. "Report of the British Association," 1902.
J. B. Carruthers, Plant Sanitation. "Contemporary Review," May, 1902.
M. K. Bamber and Herbert Wright, Enzymes in Tea. Colombo.
Herbert Wright, Foliar Periodicity in Ceylon. "British Association," Belfast, and "Annals of Botany," December, 1902.

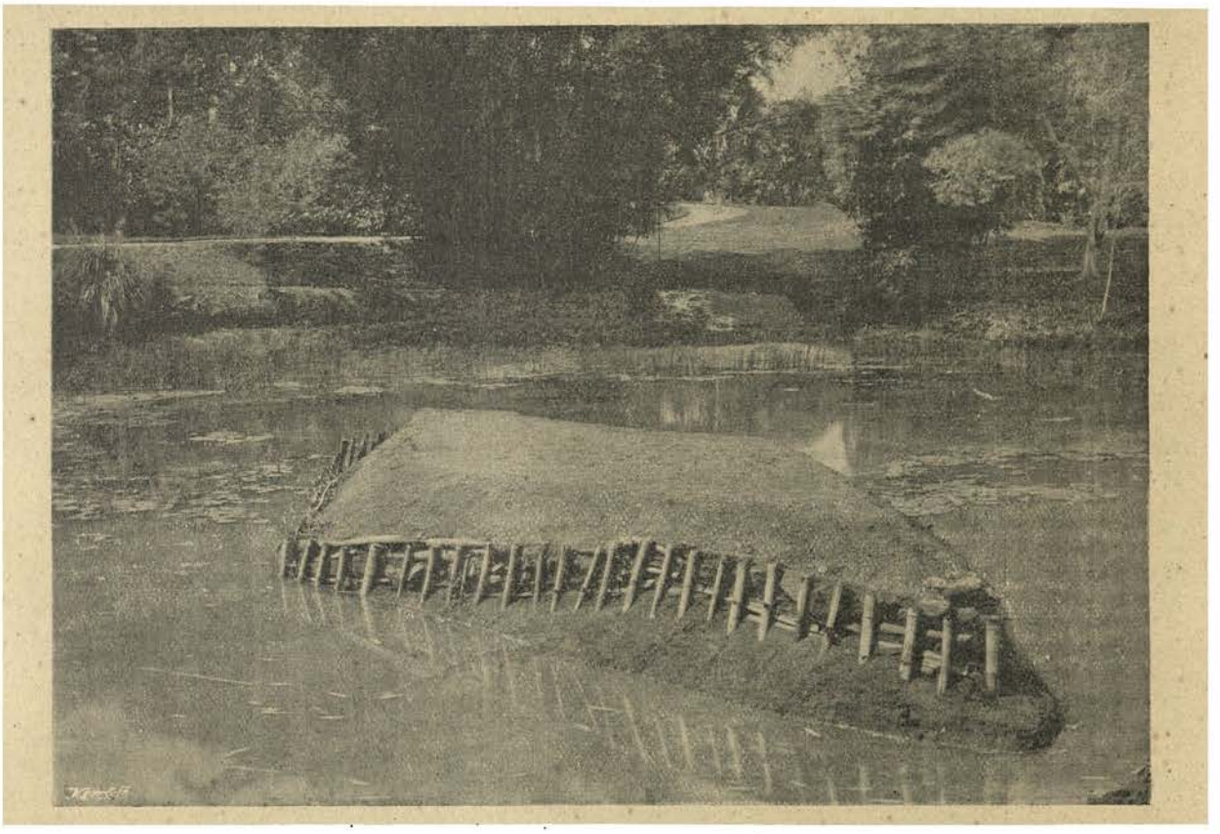
7.—DISPERSAL OF SEED EXPERIMENT.

The emptying and clearing out the ornamental lake in the Gardens afforded an opportunity for an experiment as to the dispersal of seeds of flowering plants. An island having a superficial area of about 25 square yards was formed on the lake *entirely* from the mud which had been for many years below 8 or 10 feet of water; this black mud with some rocks, which were also taken out of the bed of the lake, was moved to a central place and enclosed by means of bamboo stakes. The black mud on drying and oxidizing became a solid island of a red loam containing no seeds of terrestrial plants. The island was formed in March and April, and the water let in in June. All animal visitors to the island were prevented by a depth of black mud surrounding it before the water was let in and by the water afterwards. Up till the end of the year (eight months after it was formed) no plants had appeared on this island (some have since grown), and it is intended to examine the Flora of the place each year and record the occurrence of new plants with remarks as to the method of dispersal of their seeds. The photograph shows the island when the water was being let in, the water rising higher later. After an exceptionally heavy rainfall (see Curator's report) the island was covered by about 2 inches of water for some three days. An area of the same size near the lake, where earth from the bank had been deposited, contains some 350 plants of twenty species. These have happened there by adjacent plants spreading over the bare spot, and also by the growth of seeds present in the soil before it was removed.



NEW ISLAND IN ORNAMENTAL LAKE.

8.—PLANTS FOR DRIFTING SAND.

An experiment, which it is hoped may prove of economic value, has been carried out at Chavakachcheri near Jaffna. The railway station on the new Northern Line at that place has been seriously endangered by the filling up of drifting sand, which threatens to cover up the line and station yard. A series of plants selected from observation of natural habits and usual places of growth have been planted in the sand near the station. Half of the plants have been assisted in their first growth by adding some soil to the places where they are planted, and the other half have been left to struggle with only sand as a nidus. When these plants have been growing for some time, a report will be published of their success or failure.

9.—INTRODUCTION OF "MALE" BAMBOO.

An attempt was made to introduce into different parts of the Island the "male" bamboo plant, *Dendrocalamus strictus*, Nees., one of the most useful of the bamboos. Seeds were distributed to Government Agents and others with instructions as to their treatment in the nursery and afterwards. Some of these have succeeded, but a good many of those to whom the Government Agents gave the seeds, on finding that they did not show any sign of growth in two months, neglected them. The seed takes under good conditions some three months or more to germinate, and should grow vigorously in many districts of the Island.

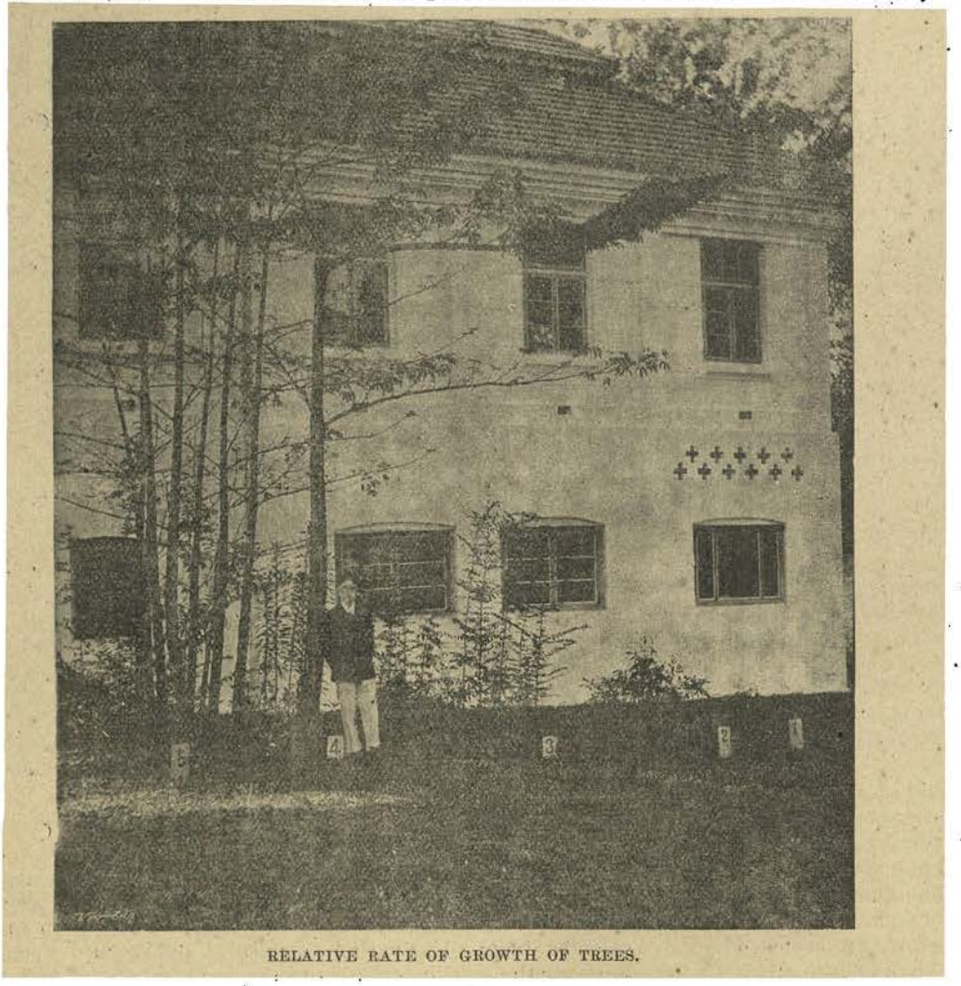
A good many trees of various kinds were supplied to different parts of the Island to be planted in celebration of His Majesty King Edward's Coronation. With the object of encouraging the planting of trees these were supplied free, but the number of people taking advantage of this opportunity was not so great as was expected.

10.—"NOTABILIA" BOARD.

The institution of a daily list of various plants in the Gardens in flower or fruit for the information of visitors will be of value in keeping a record of the flowering and fruiting period of both native and introduced plants. The list is compiled by the Curator, and will be preserved for future reference. It is placed daily on a board at the entrance gate labelled "Notabilia."

11.—PHOTOGRAPHY.

The use of photography as a most important adjunct to all accurate scientific work is generally recognized, and with this in view an excellent dark room was included in the Laboratory. During the past year the Curator, Mr. H. F. Macmillan, has been taking a series of photographs in the Gardens, and these will be preserved as a record of the plants they illustrate. This series begun will be, it is hoped, added to by workers in the Laboratory, so that a collection which will be of use in the study of many botanical questions will be available. The photographs used in this report, with the exception of those of the lake with its island and the new walk, which were taken by Mr. J. Burleigh Campbell, Superintendent of Surveys, Central Province, are the work of the Curator. The photograph on this page shows a bed laid out by Mr. Herbert Wright in February, 1900, during his appointment as Scientific Assistant, in order to demonstrate the relative rate of growth of some tropical trees. The plants to the right of the illustration labelled No. 1 are *Mimusops hexandra* (Palu), one of the most valuable timber trees of Ceylon; No. 2 is *Bassia longifolia* (Mi), a widely distributed low-country tree, from the seeds of which oil is extracted; the flowers are edible and used by the Sinhalese for food; both these trees are members of the order Sapotaceæ, the gutta percha-bearing group; No. 3 is *Diospyros montana*, with some smaller plants of *Diospyros Ebenum* behind them; Nos. 4 and 5 are *Eriodendron anfractuosum* (the white silky cotton tree), probably one of the quickest growing trees in Ceylon. The photograph was taken when the trees were twenty-three months old, and the height of the *Eriodendron* was approximately 23 feet, while that of the *Mimusops* was less than 15 inches. The seeds of all these plants were put in the bed at the same time.



RELATIVE RATE OF GROWTH OF TREES.

12.—VITALITY OF SEEDS.

A series of experiments was begun during the year to test the vitality period of the seeds of some economic plants. It is important to gain data as to the length of time that various seeds can be kept without serious loss of germinating power, and also the best conditions for keeping each seed. A number of monthly tests were made of seeds of *Hevea braziliensis*, Para rubber, harvested in September, and the results of these will be published. Castilloa seed, a very perishable seed, was also tested. It is intended to carry on these experiments with the seeds of all Ceylon cultivated crops.

13.—RETIREMENT OF THE HEAD DRAUGHTSMAN.

The retirement of William de Alwis Seneviratne, Mudaliyar, Draughtsman, after a service of thirty-six years, calls for special mention and recognition of his exceptional services in the Department. His skill as a scientific artist is known in Europe as well as in Ceylon. During his term of office he made a very large series of botanical drawings of Ceylon plants, ranging from flowering plants to fungi. The majority of the drawings illustrating Dr. Trimen's Flora of Ceylon were his work, and he was also the author of a beautiful series of drawings in Moore's Lepidoptera of Ceylon. The extensive and critical knowledge of the plants of Ceylon possessed by Mr. Alwis enabled him to be of the greatest value to the Department, and Drs. Thwaites and Trimen and the present Director have each recorded their regard for him and appreciation of his work. Mr. Alwis combined with his skill and knowledge a most courteous manner, and his resignation will be noted with regret by a large number of visitors, both resident in the Island and from foreign countries, who have worked in the

Herbarium and availed themselves of his help in identifying plants. His Excellency the Governor, in recognition of Mr. de Alwis's services, conferred upon him in 1896 the honorary native rank of Muhandiram, and later, in 1901, the still higher rank of Mudaliyar. It is a matter for satisfaction that Mr. Alwis continues to reside at Peradeniya and frequently visits the Herbarium. He was succeeded by his son, Mr. A. de Alwis, he being the third generation of his family to carry on this important work.

14.—CHANGES AND MOVEMENTS OF THE STAFF.

The Director was absent on long leave from 21st July till the end of the year. Mr. Herbert Wright was Acting Curator till 9th March, when he was appointed Controller of the Experiment Station. The Assistant Director and Mycologist carried out the duties of the Curatorship, in addition to his own, from 10th March till 17th May, when Mr. Macmillan returned and resumed his post. Mr. Edmund Jeffries, previously the lessor of Gangaroowa estate, now Experiment Station, was from the 1st January to the end of April Superintendent of that Department. Mr. R. H. Lock was appointed Scientific Assistant to the Director, and took up his duties on 15th September. Dr. Uzel had previously, from 29th June to 21st July, carried on the duties of this post, when he left for Europe. The Government Chemist, Mr. M. Kelway Bamber, was absent on leave from 15th September to the end of the year. Mr. W. P. Bartholomeusz was appointed Clerk, and Mr. J. Joseph, Foreman at the Experiment Station.

J. B. CARRUTHERS,
Acting Director.

Peradeniya, February, 1903.

SUPPLEMENTS.

1.—GOVERNMENT MYCOLOGIST'S REPORT.

ABOUT 350 inquiries have been received by the Government Mycologist in regard to diseases of plants caused both by the attacks of fungi and by adverse conditions. The investigation of the important question of the wind distribution of the spores of parasitic fungi by means of "tabernacles" at various elevations has been continued, and information is being gained which will be of much value in the elucidation of these matters.

Researches have been carried on in regard to the life-history of fungi, causing leaf and root diseases of tea, bark disease of grevillea, leaf disease of betel, pepper, vanilla, and other plants. Experiments in connection with the pollination of cacao have been conducted.

The amount of damage done to crops in general in the Island by fungal diseases has not been above the average, though the conditions necessary for the growth and spread have been more favourable during a large part of the year. The knowledge of sanitary methods in planting has to a great extent been responsible for this, and planters, as a rule, cope with outbreaks of disease earlier and so find less difficulty in fighting them.

Cacao canker, as has been mentioned in the Director's report, has not decreased, except on a few estates. There is still a tendency, especially where the disease is not very rife, to suspend the excision of the canker and the battle against the pod disease whenever labour is wanted for other purposes, and until the preventive and curative work is put *first* it is not likely that any marked progress can be recorded.

The collection of Algæ in the Herbarium has been examined and re-arranged, and some of the unnamed specimens sent to Europe to authorities in particular groups.

The amount of time available for laboratory work has been much curtailed owing to the Mycologist having added to his duties those of Acting Curator of the Gardens during March and April and the direction of the Department during the last six months of the year. A more detailed report of the work will be published later.

J. B. CARRUTHERS.

2.—GOVERNMENT ENTOMOLOGIST'S REPORT.

THE year 1902 has not been marked by the appearance of any new insects of economic importance, though most of the long-established pests have been more or less in evidence. They may be conveniently considered under the heading of the several staple products.

Tea Pests.—Most of the usual tea pests have been recorded during the year, but a few only have assumed any real importance. Of these may be mentioned—

The "Shot-hole Borer" (*Xyleborus fornicatus*).
The "Tea Tortrix" (*Capua coffearia*).
The "Tea Bug" (*Helopeltis antonii*).
The "Red Slug" (*Heterusia cingala*).

"Shot-hole Borer" (*Xyleborus fornicatus*, Eichhoff).—This pest is creating some uneasiness amongst tea planters. There is no doubt that its range is extending. At first confined to the Gampola and Nawalapitiya districts, it is now found all round Kandy, and is steadily spreading through the Pussellawa estates. Isolated attacks have been reported from Watawala, Watagoda, Pundalu-oya, Dolosbage, and Deltota. The damage is caused by a minute beetle about one-sixteenth of an inch in length. It is able to fly for short distances, and its gradual spread from a given centre is doubtless due to this natural method of distribution. But its appearance on isolated estates in

widely separated districts must be due to accidental transportation. I am convinced that the principal agency in such transportation is through the sale and purchase of nursery plants, which are often despatched by rail to considerable distances. I have myself had experience in corroboration of this theory, having personally examined plants that were being sent out from an infected estate, and found that fully 50 per cent. of such plants contained the tunnels and early stages of the beetle.

To check this method of distribution I have suggested a compulsory registration and prohibition of sale of tea plants from all infected estates until such estate or estates shall have been certified free from the pest by a personal visit of the Government Entomologist. No hardship would be entailed by such a measure. It would not interfere with the sale of the tea seed, which is not liable to harbour the insect. I understand that the matter has been referred by Government to the Planters' Association of Ceylon.

"Tea Tortrix" (*Capua coffearia*, Neitner).—This pest, which has attracted attention on and off for the last six years, has given considerable trouble in parts of the Maskeliya and Dikoya districts during 1902. Two separate visits were made to Maskeliya to study the insect, resulting in a more accurate knowledge of its life-history, which has enabled me to suggest remedial measures that should be sufficient to keep the pest in check. The eggs of the insect have been determined, and it has been found possible to collect and destroy them in very large numbers at a very small cost. A Circular on the subject was prepared in December, accompanied by a plate showing the insect in all its different stages. Through the courtesy of the Acting Surveyor-General this plate was executed by the lithographers of that Department.

"Tea Bug" (*Helopeltis antonii*, Sign.).—This important pest is always with us, in certain of the low-country districts, though its distribution in those districts remains curiously partial. There have been several reports this year of its occurrence at higher elevations, *e.g.*, in the neighbourhood of Nawalapitiya, where I myself saw it at work on one estate, and heard of others affected by it.

In March of the present year I spent a fornight in the Yatiyantota district, studying the work of the *Helopeltis* on the spot. What I then saw convinced me that the special system of plucking previously adopted, and continuously advised by myself and others, was founded upon insufficient knowledge of the conditions, and required radical alteration. The results of my investigation were embodied in Circular No. 2 (Vol. II.) under the title "Further Observations on Helopeltis."

The work of *Helopeltis* appears to have been less pronounced than usual during the latter half of the year. A system of breaking up large areas by the planting of belts of other trees is strongly advocated as an aid in combating this pest.

Some notable experiments with kerosine emulsion have been carried out by Mr. H. H. Mann on Helopeltis-infested tea in India. A sufficient time has not yet elapsed to thoroughly test the efficacy of this treatment, but Mr. Mann considers the results so far as very encouraging. His further work in this direction will be followed with considerable interest. A similar experiment on a small scale is being conducted locally on an estate in the Yatiyantota district.

A small green *Caspid* Bug, at present undetermined, was responsible for some temporary damage to tea in parts of the Bogawantalawa district. It was equally injurious to various plants in the flower gardens.

The "Red Slug" (*Heterusia cingala*, Moore) periodically attracts attention by defoliating tea in various parts of the Island. Such attacks have been recorded from Yatiyantota (January), Bandarawela (January), Maskeliya (September), and Gampola (November).

Cacao.—*Helopeltis* continues to be the principal enemy of the cacao plant. Its attacks are usually confined to the fruit, and may be there combated by the application of MacDougall's solution, or other soapy insecticides, in the form of a spray. But a more serious development of the pest occurred on an estate in Matale, where the insect was attacking the young cacao shoots, and, by repeatedly killing back the growing points, was responsible for an extensive dying back of the larger branches. This is a much more difficult form of attack to deal with. Owing to the height of the trees the collection and destruction of the insects is impracticable in such cases. This attack was confined to a small area, and the trees were so badly injured that a system of pollarding was recommended, to be followed by the collection of the insects, if they re-appeared on the new growth. The isolation of individual blocks by belts of trees, as recommended in the treatment of *Helopeltis* on tea, would be equally useful in the case of cacao.

Cardamoms.—No pest of any great importance has been reported during the year. The larva of a small Tineid Moth infesting the bulbs of the plant is responsible for a certain amount of damage, but it is hoped that means have been found to check the injury. A minute two-winged fly was found to be injuring the young shoots on one estate, but the trouble appears to be very limited.

Rice.—The well-known "Rice Sapper" or "Paddy Bug" (*Leptocorisa acuta*, Thumb.) was exceptionally prevalent in the Gampola district towards the end of the year. Several fields were so badly damaged that the rice had to be cut down and ploughed in, the harvest being entirely lost. The usually accepted remedies were tried, but produced no result. No real remedy has yet been found for this pest, and no scientific investigation of it has been made. Considering the repeated damage done by this insect, it is a matter that should be carefully studied. I hope to give the necessary attention to the subject during the coming year.

The larvæ of a Noctuid Moth (*Leucania venalba*, Moore) were received from the Hambantota District, where they were said to be very destructive to the growing rice. The caterpillars appear in vast swarms and progress slowly across the fields, eating up every green plant on their way. An allied species (*L. unipuncta*, Haw.) is a well-known rice pest in Burma. The remedy, when the plants are not too far advanced, is to flood the fields and drown the caterpillars.

Another paddy pest of minor importance is the small aquatic larva of a Pyralid Moth (*Nymphula depunctalis*, Guen.). This insect skeletonizes the green leaves of the rice plant.

Mosquitoes.—As mentioned in an earlier report, the hollow stumps of the Giant Bamboo form prolific breeding places for mosquitoes. This means of propagation has now been successfully checked locally by stopping up all the cut stems of the bamboo with clods of earth. It is found that grass soon takes root in the earth, forming a compact and permanent plug, which prevents the further accumulation of rain water.

Termites ("*White Ants*").—In my report for 1901 mention was made of some experiments in the use of Bisulphide of Carbon as an exterminant of "white ants" (Termites). These experiments

were necessarily limited by reason of the extraordinary difficulty in obtaining the chemical. Having been able to procure from India a larger supply of the Bisulphide, I have considerably extended these experiments, with the result that I am still more fully convinced of the great value of this treatment. A definite area of the Gardens was marked out for experiment, and every ant's nest within this area was treated, apparently with complete success. Bisulphide of Carbon gives off a very poisonous gas, which, being heavier than air, sinks to the bottom of the cavities and penetrates the subterranean galleries of the termites, killing every insect with which it comes in contact. All that is necessary is to pour a small quantity of the liquid into the main shafts of the nests and close the apertures with earth. The inhabitants of the nest are killed *in situ*, and the mounds may be levelled and otherwise left untouched. The difficulty in obtaining the chemical is due to its highly inflammable nature, and results in the imported article being very costly. But, given a sufficient demand, it could be manufactured locally, as it now is in India, and sold at a rate which would allow of its being extensively employed.

Acetylene Trap.—An acetylene-light trap for insects has been acquired by the Department, and experiments in the capture of various insect pests have been made with it. The result has not been very encouraging. It has been tried against the "Shot-hole Borer," Helopeltis, the "Cardamom Bulb Moth," and the "Tea Tortrix," but the last of these is the only one that was at all responsive to the attraction; and in the case of this pest also the result was not an unqualified success.

Fumigatorium.—A Government fumigatorium has been erected during the year at Kochchikada for the treatment of all imported living plants and of certain kinds of fruit. The necessary powers have been provided for its operation. Some small structural alterations that were found necessary have delayed the commencement of quarantine work, but it is hoped that the new fumigatorium will be in operation early in 1903. Considerable difficulty was found in obtaining a suitable site for the building. It was eventually erected adjoining the quarantine station for the disinfection of clothing, &c., which is situated at Kochchikada, some 2 miles distant from the jetty. It is unfortunate that a site could not have been provided directly at the harbour, as its present distance will add considerably to the inconvenience to importers, who will now be compelled to cart their goods out to Kochchikada and back again to the business quarters of Colombo.

Handbook of the Pests and Blights of the Tea Plant.—A new edition of this very comprehensive and useful work is being prepared in India by Sir George Watt and Mr. H. H. Mann. Full notes and all recent information on our Ceylonese pests of the tea plant have been supplied by this Department for incorporation in the work.

Coccidæ.—The third part of the "Coccidæ of Ceylon" is now practically ready for publication, and should be available for distribution early in 1903.

Considerable collections of foreign Coccidæ continue to be sent in for determination from India, Australia, Java, and other Eastern countries, but much of this work has to stand over from pressure of purely local business.

Identification of Insects.—Specimens of Ceylonese *Hemiptera* are being forwarded to Mr. W. L. Distant for determination and to facilitate the completion of his volumes on *Hemiptera* for the "Fauna of British India" series.

Material is also being supplied to other Entomologists working at special groups, which should result in a better knowledge of our insect fauna. *Membracidæ* are being submitted to Mr. G. B. Buckton, F.R.S.; *Termitidæ* to Mons. J. Desneux; and *Tettigidæ* to Dr. J. L. Hancock of Chicago, United States of America.

Visitors.—Several Entomologists of note have visited the Department during the year, amongst whom may be mentioned Mr. C. L. Marlatt, Assistant Entomologist to the United States Department of Agriculture; the Hon. C. N. Rothschild; and Dr. Seitz, Director of the Zoological Gardens of Frankfurt.

Sericulture.—In March last a parcel of eggs of the Chinese silkworm (*Bombyx mori*, Linn.) was procured from the Instituto Baceologico Susani, Milan, Italy. This institution guarantees their stock free from the disease that sometimes destroys whole crops of silkworms on the Continent.

Unfortunately the package arrived during my absence on tour in the Kelani Valley, and on my return the bulk of the eggs were found to have hatched out, and the young worms had died for want of food. Subsequently a few stragglers hatched out, and altogether nearly 200 young worms were saved. Four varieties had been sent, viz., Yellow Indigenous, White Indigenous, White Japanese, and Hybrid Yellow Indigenous with White Japanese. Most of the survivors were of the "Indigenous Yellow" variety. The worms fed freely upon the local mulberry leaves (*Morus alba* var. *indica*) and grew rapidly, remaining perfectly healthy, and spinning their cocoons towards the end of April. The resulting moths hatched out, paired, and deposited eggs during the second week of May.

It is recognized on the Continent that the best silk is produced by worms having only one brood during the year. Worms having two broods (known as "bivoltine") and those of quicker development (known as "multivoltine") produce silk of inferior quality. It has been found by experience in India that to ensure a healthy brood of worms it is advisable to send the eggs to the hills to submit them to a cold climate for some months before allowing them to hatch. To imitate these conditions as nearly as possible I sent half of this locally produced batch of eggs to one of the Cold Storage Companies in Colombo, where they were kept for six months at a temperature of 45° Fahr. The rest of the eggs were retained in the ordinary temperature at Peradeniya. The result was unexpected. Those eggs that had been submitted to a cool temperature for six months hatched out within a fortnight of their return to Peradeniya. The remaining eggs, though still in a sound condition, have not hatched at the time of writing this report.

From the other batch, which hatched on the 1st December, a large number (between 3,000 and 4,000) of healthy worms was raised. But during the last stage of their growth very great difficulty was experienced in obtaining sufficient food; every mulberry tree in the Gardens had already been stripped. Neighbours kindly responded to my appeal and sent contributions of leaves from their private gardens; other leaves were purchased in the villages; but in spite of all endeavours the worms, at the most critical period of their development, were often without food for many hours at a time. The consequence was that the worms developed very unevenly, and many of them commenced spinning before they should properly have done so, resulting in a crop of under-sized cocoons. Other food plants were tried, but the worms refused most of them entirely, and fed very sparingly

on others. The "Paper Mulberry" (*Broussonetia papyrifera*) was wholly refused. Lettuce leaves were only nibbled at, and the very young leaves of the "Bo tree" (*Ficus religiosa*) were eaten very sparingly and unwillingly. It is possible that, if accustomed to this latter food from their infancy, the worms might be raised upon the young *Ficus* leaves. Experiments in this direction will be made with some of the next brood; but the quality of the silk may very possibly be affected by such change of food.

To anticipate slightly, it may be mentioned that the crop of cocoons was finally gathered during the second week of January. After setting aside a certain proportion for breeding purposes, the number harvested totalled 3,152 cocoons, weighing "green" (or undried) 9 lb. 11 oz. These cocoons have been examined by a gentleman having a considerable Continental experience of the subject, who reports that, though somewhat under-sized, they are of distinctly good quality, and not, as was at first feared, of the character of a bivoltine brood.

Through the kindness of the then Director of Public Instruction, and with the assistance of the Superintendent of School Gardens, eggs were distributed to a number of the School Gardens at which mulberry trees had previously been planted. This distribution was chiefly made from the batch of eggs that had been kept at Peradeniya, and they have not yet hatched out. The delay, however, will allow of the better growth of mulberry for their future food. A paper on "Silkworms and Silk Culture" was drawn up and has been translated into the vernacular for the use of the school teachers.

The difficulty of providing a sufficiency of food for the comparatively small number of worms raised at Peradeniya shows the futility of attempting the industry of sericulture amongst the natives of Ceylon until mulberry trees have been widely established throughout the Island. With this view large nurseries of mulberry plants are being laid down, and it is proposed to ask the aid of the Government Agents of the several Provinces to assist in the distribution of the plants.

Meanwhile the experiments carried out during the past year have demonstrated the complete practicability of raising healthy worms and good silk cocoons in Ceylon. The present crop of cocoons has been steamed and dried to prevent the emergence of the moths, and a sample will be sent to Europe for valuation.

Mr. P. N. Braine has sent in a number of pierced cocoons of the large Indian Silkworm (*Attacus ricini*, Boisd.), which had been raised in Ceylon. This species feeds upon the castor oil plant, and could consequently be cultivated here without any difficulty. But a report on a sample of these cocoons submitted to a European expert is not very encouraging. The report states that the sample is of good quality, that five or six years ago these cocoons would have been worth 3*s.* 6*d.* a pound for manufacture of silk plush, but that the demand for that material has now declined, and that they would fetch only 8*d.* a pound at the present time. As a pound avoirdupois contains over 1,600 of the cocoons in question, it is evident that at the existing prices they would scarcely repay cultivation.

Some cocoons of my first batch of worms, raised from Italian eggs, were sent to Europe for valuation. From this report it is calculated that the value of the dry cocoons would be about 32*d.*, or of fresh cocoons about 10⅔*d.*, per pound. But the experiment was on too small a scale to give any accurate data for calculating the cost of production.

It is doubtful whether the actual raising of the worms would ever repay European attention in Ceylon. But that they could be profitably grown by natives is shown by the large industry in cocoons grown by the peasants of Southern Europe. The worms can be attended to by the women and children at home while the men are at work in their fields.

It will be well to look ahead and consider the means necessary to start and stimulate the industry. I would suggest that the School Gardens would at first form good centres of instruction. Eggs could be supplied from this Department, together with full instructions for the treatment of the silkworms. It might perhaps be advisable for the Government Entomologist to make a round of visits to the several centres during the critical period, just before the worms commence spinning. A prize might be offered for the best crop of cocoons raised. The surrounding villagers should be encouraged to watch the experiments, and should be supplied with eggs, if they desired to raise cocoons for themselves.

It is certain that to induce the natives to start such a novel industry it must be shown to them that there is an immediate market for the produce. To ensure this it may be necessary at the commencement to arrange for the purchase of the cocoons at a fixed rate for re-sale to one of the Indian silk factories. The principal difficulty will be the collection of the cocoons from a number of separate localities in good condition and at the proper stage. The moths emerge in about two weeks after the formation of the cocoons. Cocoons from which the moths have been allowed to escape are known as "pierced," and are practically valueless. It is necessary, therefore, to kill the cocoons, before the period of emergence. This may be effected by submitting them to the action of steam, after which they must be carefully dried in the shade. This work is usually undertaken by the purchaser. Under local conditions it may be necessary to appoint agents in several centres to collect and cure the cocoons. After the natives have become thoroughly accustomed to the raising of the worms they might be instructed in the art of spinning the silk for utilization in their simple looms.

Lac and Lac Work.—A visit to the Tangalla district was made early in the year to study the lac industry, one branch of which is localized in that neighbourhood. Another class of lac work is centred in the Matale District. A complete series of specimens of each class of the work and the materials employed was collected and prepared for exhibition in the Departmental Museum. A report of the industry has been drawn up, and will appear in the "Handbook of Economic Products of Ceylon" now in course of publication.

The industry is a most interesting one, and, being in the hands of only one or two families, who jealously guard their methods as a trade secret, is in some danger of dying out. It could be greatly assisted by the introduction of the Indian lac insect, which secretes a much greater quantity of the resinoid substance. Several attempts have been made to import the living insect from India, but so far without success.

It was intended to publish a Circular describing in greater detail the entomological work of the Department during 1901, with numerous notes that could not conveniently be included in the Administration Report. But this matter was so long delayed by press of other work that it was thought better to wait and issue such a Circular to cover the observations of the two years 1901–1902. This work will now be immediately put in hand.

E. ERNEST GREEN.

3.—REPORT OF THE CONTROLLER, EXPERIMENT STATION.

THE cacao was the first product to receive attention, as quite 96 per cent. of the trees, over 150 acres, were badly diseased with the cacao fungus; the condition is obvious from the facts that only 22 per cent. of the fruits collected during the year were mature and good, and from May to December no less than 88,765 fruits affected by fungus and 19,375 fruits destroyed by squirrels were collected. The cacao crop for the year 1902 consisted of 41 cwt. of black, *i.e.*, diseased, cacao out of a total of 125 cwt.

Such a condition necessitated prompt action, and the excising of the cankered bark, burning of all diseased tissues, and felling of trees was commenced without delay. The advantages of this treatment may be judged from the fact that the percentage number of fungus pods was reduced from 62 per cent. in August to 24 per cent. in December, even though the latter months were more favourable to the spreading of the fungus; furthermore, the crop returns for the past year show an increase of 32 cwt., or 0·21 cwt. per acre, over the previous year's return. Once the cacao has had a chance to recover with the help of a little sunlight, the establishment of suitable shade or wind belts will be considered.

Spraying experiments on small plots have been carried out, the mixtures used being copper sulphate with lime and water or with mud and water. These experiments have proved the power of these reagents in keeping down the disease on the fruit, and the interest which many planters have evinced in these experiments has been most satisfactory. Spraying and manurial experiments will be continued next year.

Cardamom plots have been arranged along the hillside on the "stool" and "terrace" systems; a plot of citronella has been established along the hillside, where it grows profusely; and other species noted for the essential oil they contain have been obtained from various sources.

Seeds of the "Patana," "Calcutta," "Madras," and "Major" varieties of castor oil plant have been obtained, and the yield per acre of this largely imported product will be determined.

Castilloa rubber plots have been established on ground previously occupied with cacao. A small sericulture plot and areas for experiments with green manures have been selected.

One plot of cocoanuts has been established on land previously occupied with cacao, and will subsequently receive additions in the form of Maldive and Javan types already in the nursery.

Fibres have received attention, and plots have been laid out for determining the yields and qualities of this product from the following species:—*Musa sapientum*, *Sanseviera zeylanica*, *S. guineensis*, *S. cylindrica*, *Calotropis gigantea*.

Tea experiments have been started. Twenty-five separate one-acre plots are now being arranged for experiments with the light- and dark-leaved indigenous jâts, the China jât, and an Assam hybrid. Experiments at different elevations throughout the Island will probably be undertaken during the present year.

The details of the experiments and general work done since taking over in March last, and an account of my work as Scientific Assistant up to 30th June, are fully given in the separate report of the Station.

HERBERT WRIGHT.

4.—GOVERNMENT CHEMIST'S REPORT.

A LARGE series of distillations of citronella, lemon, and mana grass from several districts and different elevations have been made with a view to the improvement of citronella oil.

A visit was made to Matale in connection with an investigation into the dyes employed by the Sinhalese in the Matale District for colouring mats and fibres. These beautiful dyes lose much of their value from the fact that they fade away, especially when exposed to direct sunlight. Experiments are being made to discover a mordant which could be cheaply and practically used for fixing these colours.

Experiments have also been made to render waste salt unfit for human consumption, so as to allow its being employed for manuring purposes. No cheap non-poisonous article has yet been discovered that will prevent easy re-crystallization of the pure salt.

Soils from every part of the cultivated area on the new Experiment Station have been analyzed and fully reported upon with a view to manuring and other experiments, and these will appear in a more detailed report. Lac, jak fruit, and other minor products have been analyzed.

A chemical laboratory has now been fitted up at Peradeniya, and I hope to carry out much of the work there instead of in Colombo, as was before necessary.

I was absent from the Island on leave from 15th September to the end of the year.

M. KELWAY BAMBER.

5.—SCIENTIFIC ASSISTANT'S REPORT.

THE Scientific Assistant entered upon his duties in the month of September. The last four months of the year were chiefly occupied in experiments concerned with the cross-breeding and selection of a variety of food plants, chiefly leguminous vegetables.

It is hoped that, in addition to their purely economic importance, some of these experiments may help to throw light on those problems connected with the subjects of inheritance and variation in plants, which are at the present time receiving considerable attention among biologists, and which

form the special subject of much recent work by Bateson, De Vries, Correns, and others. For this reason the experiments in crossing have been planned so as to test as far as possible whether the plants studied agree in their behaviour with the numerous forms for which "Mendel's law" has now been shown to hold good.

Amongst other experiments in *crossing*, a number of artificial pollinations have been carried out with various forms of dwarf kidney beans (*Phaseolus vulgaris*) and of garden peas (*Pisum sativum*). In the case of the latter plant a considerable number of successful crosses have been made; but in that of the former, largely owing to the exceptional rainfall in October and November, only a very small percentage of ripe pods have been obtained from flowers artificially pollinated. From such as have ripened, however, seed has been sown and a number of hybrid plants have germinated.

A few crosses were also attempted between different *species* of *Phaseolus*. Some of these crosses, namely, those between closely related species (*e.g.*, *Ph. multiflorus* × *Ph. vulgaris*) were to some extent successful, whilst others, between more widely separated species (*e.g.*, *Ph. Mungo* × *Ph. vulgaris*), failed entirely.

A number of other cultivated species of leguminous plants, for example, species of *Vigna*, *Canavalia*, *Mucuna*, *Dolichos*, &c., have also been sown with a view to crossing. At the time of writing most of these plants are in flower, and artificial pollinations are being attempted.

Several varieties of garden peas and also of sweet peas (*Lathyrus odoratus*) were sown at the Government Garden at Hakgala in the hope of carrying out a series of parallel experiments at a higher elevation. Information received from Mr. Nock shows, however, that the effects of rain have there been even more disastrous than at Peradeniya.

In the case of both pea and kidney bean crosses are being made between native-grown forms and plants grown from seed obtained from Messrs. Sutton of Reading and from Messrs. Barr of London, in the hope of obtaining improved forms suited to the climate of this country. Thus, a native-grown pea with round yellow seeds has been crossed with several of Messrs. Sutton's named varieties of green wrinkled-seeded peas.

The same round yellow pea forms the subject of experiments in *selection*. A separation of the largest seeds in a sample has been effected by a process of actual measurement, about 2,000 peas having for this purpose been measured to ·2 of a millimetre. In future generations it is proposed to select from individual plants, which are for this purpose being grown in specially manured soil. It is hoped to obtain a check upon climatic conditions by selecting from the smallest as well as from the largest-seeded examples. It is also proposed to select seeds of irregular shape, as opposed to the normal form characterized by smoothness and roundness, in order to discover whether by a continuation of this process through several generations a wrinkled-seeded race can or cannot be obtained, since the recent tendency of views on the nature of varieties renders it doubtful whether so distinct a character can in this way arise.

With a view to crossing and selection experiments with plants of another type, "seed" of different coloured varieties of *maize* (*Zea mays*) has been sown, and the plants have now nearly reached the flowering stage. Some well-marked races of the same species have lately been received from America, and these have now been sown and have germinated successfully.

A few cross pollinations were attempted between forms of cacao (*Theobroma cacao*), but, owing to the period of most abundant flowering being past, it was found necessary to postpone this work. Meanwhile, data is being collected for a statistical examination of the variations in seed colour exhibited by the cacao plant, and it is hoped that this work may lead to a classification of the Ceylon races founded largely upon this character. The work has already been carried far enough to confirm in its main features the classification proposed by Mr. Hart for the Trinidad forms. Plants agreeing with each of Mr. Hart's principal types are to be found growing either in the Botanic Gardens or upon the Experiment Station at Peradeniya, but the majority of trees upon this latter estate appear to belong to a Ceylon red type distinct from the Trinidad Criollo form, although more nearly related to it than to either of Mr. Hart's other types.

Among other work of less practical interest, an examination of the seedling anatomy of some Ceylon species of *Memecylon* is being undertaken.

R. H. LOCK.

6.—REPORT OF THE CURATOR, PERADENIYA GARDENS.

Routine and Improvements.—I returned from leave and resumed duties on 17th May. The routine work has been carried on with the usual efficiency, though the general condition of the Gardens has somewhat suffered owing to the curtailment of the Labour Vote by nearly one-fifth on account of the Gangaroowa Experiment Station; besides this, labour to the extent of Rs. 109·77 has been used on clearing out the water pipe, whilst the experiment plots at Peradeniya have taken over Rs. 250.

Several improvements have, however, been effected, notably the new walk with bamboo bridge on the East Riverside, which was planned and carried out by the Acting Curator.

Much labour was spent in the early part of the year in emptying out the lake and forming an ornamental island in it. A portion of the lake has been set apart as a bog garden for the purpose of growing plants requiring aquatic or semi-aquatic conditions. It has not, however, been possible as yet to carry out this idea satisfactorily. Meanwhile, the island being left unplanted, observations are being made as to what species of plants that may appear spontaneously on its surface, the soil of which having been mainly dug up from under strata.

The Museum border has been much improved by removing all the shrubs, except isolated specimens, the ground being turfed over.

A much-felt want has been partially supplied by the building of seats at suitable spots in the Gardens. These were designed by Mr. Carruthers, and combine strength and durability; they are also fixtures, which is here a great consideration. Each seat consists of joints of giant bamboo fixed in the ground and filled with concrete; cross pieces are fixed to the concrete by means of wire ends

sunk in the latter, slabs of kitul (*Caryota urens*) form the seat and back support, and this completes the structure.

An item worthy of mention is a new pot or vase originated also by Mr. Carruthers. This is made by cementing together at the edges three ventilator tiles (Mangalore tiles), and forming a bottom of cement with holes left for drainage. Any spare ventilators can thus be profitably utilized, while they may at any time be separated and used for their original purpose.

An innovation suggested by the Government Entomologist, viz., the daily "notabilia" board, is being much appreciated by local and foreign visitors. A selected list of notable plants in fruit or flower in the Gardens and other features of interest is prepared by the Curator, typewritten, and posted up at the Entrance Lodge from day to day.

A plot of land behind the palmirah avenue has been reclaimed for the purpose of experiments upon the acclimatization of exotic vegetables and the improvement of indigenous ones. This is necessarily a work which requires a great deal of attention, and must be continuous to have any good effect. Until, however, this space is enclosed by a barbed wire fence to prevent damage by cattle, it is difficult to conduct experiments or to obtain useful results.

NEW WALK ON EAST RIVERSIDE.

It may be worthy of mention that, in order to have as complete a record as possible of all important specimens (botanical or entomological) in different stages of their existence, as well as of important features in or in connection with the Gardens, a beginning has been made to form a series of photographs of these.

The scantiness of the water supply is the greatest drawback of the Gardens. In a period of dry weather the various experiments in progress, the propagation of plants by layering, grafting, &c., the young plants put out in different parts of the Gardens,—all these suffer seriously in dry weather. The carrying of water in watering cans or barrels from small tanks or from the river often to distant parts of the Gardens is but as mere dribblets compared to the quantity required. This will be remedied to a great extent when, as at present proposed, the 4-inch main water pipe will be branched to different sections of the Gardens with standpipes and taps at places where water is most needed. It will then be possible to use a garden hose (an important desideratum); this would effect great economy of labour, and it is obvious that all plants coming within reach would greatly benefit thereby. Another great advantage to be gained from this system is that many of the small pits at present used for collecting rain water, and which act as breeding areas for mosquitoes, can be dispensed with.

Three substantially built wells have been sunk by the Public Works Department, one to supply the Entomologist's quarters, one for the bungalows of the Director, Curator, &c., the other for the Foremen's houses, cooly lines, &c.

Propagation and Planting.—The stock of economic and ornamental plants for supply purposes having become exhausted owing to an unusual large demand, the propagation of these has been vigorously carried on. Seeds and plants of a large number of indigenous and exotic species have been obtained for stock purposes, as well as for supplying vacancies in the Garden collections.

Hitherto there has been no special provision here for displaying ornamental climbers, many of which have consequently been generally obscured. This has now been obviated, and young plants of all the most handsome species of climbers in the Gardens have been propagated and planted in the flower garden along the East Drive; these number at present about thirty distinct species, and all are in a thriving condition. It is intended to build brick pillars at suitable distances apart, and to train the climbers in loose festoons on wires fixed to the pillars. Being close to the drive, and all bearing large labels, visitors will no doubt appreciate this arrangement. A pamphlet on "Ornamental Climbers" is now in course of preparation.

An avenue of different varieties of cocoanuts has been planted below the Curator's Office, the plants being raised from seed received from Mr. W. H. Wright, Mirigama, in 1901.

A plant of the West African breadfruit (*Treculia africana*) was planted by Mrs. Carruthers on 18th August to commemorate the King's Coronation. The situation chosen was near the trees planted by Royalties, which fortunately did not interfere with this plant being planted in its proper natural order section, viz., *Urticaceæ*.

The flower garden has been much improved and somewhat extended, several new beds being made and old ones re-arranged, all being thoroughly trenched and manured. Some superfluous trees here have also been cut down.

NEW AVENUE OF OREODOXA REGIA (PLANTED JUNE, 1898).

Advantage was taken of the long spell of wet weather for propagating by layering and gooteeing such plants as *Amherstia nobilis*, *Bauhinia anguina*, and other hard-wooded kinds which only rarely produce seed. The success of these, however, has been much interfered with by natural disadvantages (chiefly strong winds and scarcity of water), as well as by the spirit of destructive curiosity on the part of a certain class of visitors. This latter evil is persisted in, notwithstanding remonstrances, fines, and rewards for detecting.

Economic Plants.—In view of the promising importance of the silkworm experiments now being carried on here, a plot 60 feet by 60 feet has been planted out with mulberry trees. A stock of these has also been raised for supplying applicants, and several thousand plants are now available. A quantity of mulberry seed was received from Japan during the year and distributed to likely growers, but in all cases this failed to germinate. The tree is, however, readily propagated by cuttings, and for practical purposes this will be found the best way of reproducing it.

The twelve plants of "Nicaraguan Creole" cacao received from the Botanic Gardens, Trinidad, in 1895, and planted out in the experiment plots in April of 1896, have produced a fair crop of fruit this year for the first time. Most of the fruit, however, is required for purposes of comparison, classification, and experiment.

Of the two plants of *Theobroma pentagona* received at the same time from Trinidad, one only survives. This has also borne fruit for the first time, which is likewise required for scientific purposes. The pod of this latter is readily distinguished from all other varieties of cacao, having five large longitudinal ridges or wings. Three more plants of this species were received from Kew in the latter part of 1900, and have this year been planted out alongside with the above.

A large collection of Japanese vegetable seeds were also obtained from Japan for the purpose of testing their suitability to our climate, and of making known such as proved worthy of it. The results, however, were disappointing, which no doubt was largely due to uncongenial conditions of climate. The "Japanese cabbage" turned out to be like an inferior kind of lettuce, whilst the "Japanese carrot" put forth leaves freely, but developed roots suggesting the English wild carrot. Almost equally disappointing were the "Japanese onions." The "Japanese radish" and "Soya bean" gave the best results. The latter grows here freely, and produces a good crop of fertile seeds. It is as well to mention, however, that unpleasant symptoms sometimes result from eating these beans, even when well cooked and served with butter, &c.

A number of plots have been sown or planted with several kinds of grasses, both indigenous and foreign, with the object of determining the most suitable for fodder, pasture, or lawns. It is almost conclusively proved that *Paspalum dilatatum*, upon which much has been written in recent years, though it grows moderately well, will not equal, much less supersede, "Mauritius" or "Guinea" grass at elevations under 2,500 feet, either for fodder qualities or for adaptability to soils. For up-country, however, this grass is undoubtedly a valuable acquisition, becoming readily acclimatized and producing seed freely.

A dozen different varieties of grafted mangoes have been obtained from the Botanical Gardens, Poona. These include some of the best varieties known. Some have been sent to each of the branch gardens, and the rest carefully planted out at Peradeniya.

The twelve plants of *Coffea stenophylla* ("bush" or "native coffee" of Sierra Leone), received from Kew in 1894, have produced a good crop of fruit here for the first time. Their fruiting has been retarded by their being planted out at first in an unsuitable situation, where they made but little progress, and by being again transplanted in 1898 to their present position, viz., in the experiment plots. The berries are small, but are reputed to be superior to all other coffees in point of flavour, and this is confirmed to some extent by a small trial made here. Most of the seed produced has been sown. A Circular is being prepared on this subject, and will be issued shortly.

The *Funtumia* (*Kicksia*) or "Lagos rubber" plants raised from seed received from Lagos in 1899 and planted out in 1900 are making healthy and rapid growth, some of them being 12 feet high and of a bushy habit. They are subject to attacks in November and December by the caterpillar of a moth (*Caprinia conchylalis*), which lodges in the young leaves and curls them up around it.

The demand for Hevea seed far exceeded the supply, more particularly as regards foreign applicants. The seed being of short vitality, experiments are being carried out to ascertain the conditions under which they travel best.

The cubeb plants (*Piper Cubeba*), received from Java between 1888 and 1900, have this year produced a moderate crop of fruit for the first time. Their tardiness in fruiting is probably due to the plants having been raised either from seed or from non-fructiferous shoots. Hitherto it has been considered doubtful whether these were genuine cubebs, but a cubeb planter from Java, who has seen our plants in fruit, assured us in the affirmative, though apparently they are an inferior kind.

Amongst local applications for new products have been several which had reference to the cultivation of pineapples for export. A special request was made for information regarding the West African oil palm. This was given with instructions for cultivation, &c.; seed was also supplied to plant up a small acreage. Various inquiries were received during the year, both locally and from India, regarding fibre plants, more especially the Sisal hemp, of which we supplied a quantity of plants and bulbils. There has also been a certain revival of interest shown in pepper cultivation, judging by the number of inquiries received on the subject.

Interesting Plants in Flower or Fruit.—The following trees flowered here during the year for the first time, viz., *Buckinghamia celcessima*, a large evergreen tree of Queensland, and *Pachira insignis*, a small tree of Tropical America; the latter also fruited; the fruit on ripening opens and discloses a mass of silky down, giving the tree a pretty effect, from which it derives its specific name. Several of the "cannon ball" trees introduced from Tropical South America in 1881 (*Couroupita guianensis*) have now become prolific fruit bearers, this year seeing a record in the number of fruits produced. The latter, intermixed with the large racemes of peculiarly formed flowers, make the trees an interesting feature on the East River Drive. The Brazil-nut tree (*Bertholletia excelsa*), also of South America, has produced a single fruit, which however has not ripened up to the end of the year. The separate carpels of this fruit form the well-known Brazil-nuts of commerce.

Buildings and Roads.—Both of these are a serious tax on our resources. Defects in roofs or foundations of buildings used for botanical purposes should of course be at once repaired, and the carrying out of such work at frequent intervals and the repairing of roads and paths absorb a considerable portion of our labour vote.

The conversion of the godowns at the Herbarium and Library into suitable offices for the Director has been completed, the work being done by garden labour. The Second Foreman's house has undergone considerable repairs, and necessary outhouses have been built. The Gardens have also had to do urgent repairs to the Draughtsman's and Arachchi's houses.

Many roads and paths, which are greatly in need of repair, have been unavoidably overlooked to some extent, owing to so many demands being made on our already curtailed labour vote. The effect of the protracted rains on these has also been very considerable. The most urgent repairs will however, be put in hand with the beginning of the new year. Several culverts have been emptied of silt and rebuilt. A new and much-needed culvert has been built on the slope of the drive to the Museum.

Correspondence.—The clerical work of my department has much increased of late, more especially since the re-organization of clerical work at the beginning of the year. The number of letters received by or referred to the Curator from 17th May to end of year is 926, the total for the year being 1,287; whilst the number of letters issued from 17th May is 864, or 1,098 for the year.

Additions to the Collections.—Hitherto it has been customary to give under this head a list of the plants introduced during the year under review. It is now considered advisable to discontinue this, because, however carefully compiled, the list is liable to be misleading. With the attempt to include all the introductions of the year, many of the plants so enumerated can only be still in a young or seedling state, and are therefore not beyond the experimental stage at the time of being recorded. A complete series of records (since 1895) of the introduction and progress of plants from foreign countries is kept at the Curator's Office.

7.—REPORT OF THE SUPERINTENDENT, HAKGALA GARDEN.

Buildings.—The guttering around the Superintendent's bungalow has been overhauled, repaired, and re-painted. The woodwork of the verandah and the doors and windows outside have also been painted. The large heavy door of the sitting-room has been replaced by a double door of teak wood. This is a great improvement both in appearance and comfort, and will prevent the continual repairs to the plastering, which was being continually brought down by the old heavy door. The back verandah leading from the bungalow to the kitchen has been ceiled with white pine boards. Some slight repairs were done to the plastering of the inner rooms, and the walls of the bungalow and godowns have been colour washed. A stove has been placed in the kitchen, the brick oven repaired, and a new window inserted in the kitchen wall.

The roof of the bungalow is getting very unsightly, the corrugated iron being very old and rusty. It leaks in several places, and requires to be overhauled and painted.

The shingled roof of the godowns leak badly and need to be renewed, as the shingles in many places are quite decayed.

Clerk and Foreman's Quarters.—This building has been completed. Concrete drains have been laid all round and guttering fixed under the eaves of the front side. A kitchen hearth and chimney have been built, a small stove placed in the sitting-room, and this room and one of the bedrooms have been ceiled with pine boards. The above work was carried out by the Public Works Department, and a small wood shed and cattle shed have been built by the garden coolies.

Laboratory.—The fireplaces in the laboratory were completed; two bedsteads, six tables, and five sets of shelves were made and fitted up; the front walls painted, the back and two ends colour washed, and the doors and windows painted.

Propagating House and Pits.—The woodwork of these buildings has been thoroughly cleaned several times during the year. It now requires re-painting badly, and it is hoped that means will be provided for this during the coming year.

A portion of the stage in No. 1 division of the propagating house collapsed in April, causing much damage to the plants and flower pots. As all the stages were in a bad state, and to prevent further disaster, new staging, wallplates, and facing boards were put in all round, the timber for this work being sawn from trees in the garden. The pillars, both in the propagating house and the pits, were repaired and the walls whitewashed. Several lights in No. 2 pits were renewed and others repaired.

Cooly Lines, Cattle Sheds, &c.—The cooly lines received the usual whitewashing of the walls inside. All the woodwork was well tarred and the pillars whitewashed.

Slight repairs were made to the visitors' carriage shed, and a good coat of hot tar was given to the woodwork.

A small stable, 13 feet by 11 feet, has been erected near the carriage shed. This has supplied a long-felt want, as hitherto there was no place to put up an extra horse during a shower or for an occasional night, the small stable at the Superintendent's bungalow being only large enough for one.

The No. 3 Rustic Arbour, erected twelve years ago, being too far decayed for repairs, was removed, and a new one of the same size and design has been built on the same site.

The foolish habit of a certain class of visitors of writing their names in pencil, or charcoal, or cutting them out on the tables, benches, and rafters, besides being unsightly, is destructive to the woodwork, which has to be frequently scrubbed or planed, and I trust these few words will be sufficient to lead to the practice being discontinued.

A small shed has been erected near the Superintendent's bungalow for storing firewood.

The unusual and continuous wet weather during the latter part of the year has caused much damage to the roofs of the thatched lines and sheds, and nearly all will require to be repaired and re-thatched during the coming year.

Potting Shed.—This building has been much improved by glazing the end and sides round the potting bench and the side where labels are written and seeds sown. This admits ample light, and work can now be carried on comfortably even in wet and windy weather.

Young Gardener's Rooms.—Minor repairs were done to the plastering, ceiling cloth, &c., and the usual whitewashing was carried out in October. These rooms now require to be thoroughly overhauled, and it is hoped that means may be provided to carry out this work during the next dry weather.

Drives and Paths.—During the first two months of the year the main drive and paths were put in thorough repair. 1,000 running yards of 12 feet drive was re-made, metalled, gravelled, and consolidated, rough sand being rolled in on the surface. This was kept in perfect order until the heavy rains in October, November, and December, which, being so heavy and persistent, washed away all the sand and gravel. However, by constant rolling and attention to the surface drains the metal has been kept in place, but new gravel and sand are required to put it in perfect order again. Gravelling is an expensive item here, for gravel is scarce, and where found it is in such thin layers that it takes a long time to collect, and has to be carted or carried considerable distances.

2,682 lineal yards of 4-foot wide paths were repaired at the beginning of the year. These were filled up with strong red soil varying in thickness from a few inches to one foot. Rough sand carted from the river at Sita Eliya was spread on the surface of these paths and the drive, measuring together 3,682 lineal yards.

During April the paths in front of the bungalow and propagating house and the cross paths in the Flower Garden, measuring 174 feet long, were re-made.

A new path 250 feet long was traced from the fernery path to the lower terrace of the new nursery. This took up considerable time, as to get a good curve and a fairly even gradient a good deal of earth and rock had to be removed.

The paths leading from the gardens to the public road at Gorindihela and those in the upper part of the gardens leading to the Reservoir, Camphor, Casuarina, Pinus, and Oak plantations were kept in good order until the heavy rains in October. All these paths and those in other parts of the garden, including the new path to the nursery, are now very much cut up, and considerable labour and material are required to put them in repair again.

Further improvements have been made to the bridle path across the patana and leading to the Ambawela station; 500 yards of it, starting from the laboratory, have been widened and drained, and

a large earthslip, which occurred in October, has been cleared away. The bank here, which is 20 feet high, was cut back and sloped down to the path. The above work was done by the garden coolies Much improvement in the way of widening, cleaning, and draining has been done further on by the superintendent of a neighbouring estate.

The drains on the upper side of the main drive have all been deepened, and the silt and soil taken out from them have been spread among the shrubs.

A new culvert 26 feet long, 2 feet broad, and 3 feet high has been constructed under the drive near the lower entrance to the Fernery. This replaces a small and badly constructed culvert, which got choked during excessive rains, and which was the cause last year of the large washaway in the main drive. The new culvert has proved sufficient to carry off all the sudden, heavy, and excessive rains this year. The excavation for this culvert had to be 7 feet deep and 8 feet wide. The quarrying and transport of stones for this work took up a good deal of labour. The large culvert near the cattle shed has been rebuilt, and three other culverts in the main drive have been repaired.

Large stones were fixed at the corners near the carriage shed to keep carriages off the turf verges, and the "Irish" drain near this was relaid. Sixteen cross drains in various parts of the garden paths were repaired or relaid.

Turf Verges.—The turf verges on each side of the drive, besides being much damaged by the work of re-metalling the drive, having become very thin and worn out, were removed. The margins of the drive were dug up, prepared with fresh soil, and 1,746 lineal yards of new turf verges 14 inches wide were laid down. In November 53 yards were laid down near the propagating house and alongside of the path at the upper entrance of the fernery.

Fernery.—With the exception of the paths which were much damaged by the heavy rains in October and November, the fernery has been maintained in good order all through the year. Many of the beds have been forked up and re-planted. 4,650 assorted ferns, begonias, and such like plants have been planted out during the year in supplying and filling up vacancies.

New verges of dwarf selaginella have been planted along the sides of the paths, and several rocks have been covered with mosses, selaginellas, and orchids.

A large quantity of orchids, both indigenous and foreign, have been affixed to the trunks of the trees, and many of them have become established and have flowered. Balsams, begonias, primulas, and other plants have flowered well among the ferns at different times, which has added much to the appearance of this part of the garden.

A new border was formed at the north-west corner and planted with suitable ferns and shade-loving plants.

Porcupines caused considerable damage on two occasions, destroying lily bulbs and many other thick-rooted and succulent plants.

Nurseries and Plant Sheds.—The oxalis pest had so overrun the old nursery that it was decided to open a new one. This was begun in April, and a piece of forest was felled between the camphor plantation and the corner of the main drive above the lakelet. The preparation of this ground took up all the labour that could be spared, from the ordinary upkeep of the garden, for five months. This land being steep and containing many old trees, some of them having bases 6 feet or more in diameter, the work of removing them and taking out all the roots was very heavy. After this was done the land was terraced so as to give level ground for the nursery beds, and was so arranged that all the beds can be irrigated when necessary.

There are six terraces, giving a total length of 740 feet, with an average width of 12 feet. The six banks of the same length give an average depth of 7 feet. These banks have been planted up with 5,300 roots of fodder grasses: *Paspalum dilatatum*, *Bromus inermis*, *Panicum maximum*, and a few others. These grasses, with the exception of the *Panicum*, for which the soil and climate is not suitable, have become well established, and answer the purpose of keeping up the banks and at the same time giving a supply of fodder. The terraces have been dug to a depth of 20 inches and enriched with jungle soil. Many thousands of young plants and cuttings have been set out in them.

A barbed wire fence on wooden posts has been erected with 2-inch mesh wire netting 4 feet high, fixed all round to keep out hares, porcupines, &c. The length of fencing measures 439 feet, and encloses an area of about 3,000 square yards.

Minor repairs were made to the plant sheds after the south-west monsoon, and all were kept in good order during the year. They will, however, all require to be re-thatched during the coming year.

The usual stock of plants for sale and distribution were kept up in the nursery beds, and 7,500 were established in supply baskets for the same purpose. 700 Azalea shoots were layered and 1,000 cuttings of Azaleas were put in. 1,148 packets of seeds were sown in pans and boxes, and several batches of the hardier seeds were sown in the open nursery. 78,500 seedling plants and struck cuttings were pricked out or transplanted into pans, boxes, nursery, plant sheds, and beds. 58,800 assorted cuttings were put in the nursery and propagating houses, and 5,880 plants were potted.

The number of economical and ornamental trees, fruit trees, bulbs, and general garden plants distributed during the year was 19,987, besides 4,967 cuttings and 17 packets of seeds. The number of plants propagated and supplied gratis to public grounds and the new gardens at Nuwara Eliya and Diyatalawa Camp was 8,100. 5,700 wooden labels were made and written during the year in labelling plants, chiefly in the nurseries and propagating houses, and 145 plant boxes were made.

Borders and Shrubberies, Improvements, &c.—136,347 plants of ornamental trees and shrubs, herbaceous plants, and general garden plants and bulbs were set out during the year in the upkeep of the gardens, the majority being annuals and edging plants.

The beds and borders now number 147, and these have all been dug up, encroaching roots removed, new soil added, manured, re-made, and re-planted. This was done during the last three months of the year, but most of the beds are re-planted twice during the year, and some oftener, so as to keep them full of flowering plants. Fifty-three bushels of oxalis tubers were weeded out of the borders during the year.

All the shrubberies have been forked over, supplies put in, and a good deal of thinning out and pruning were done. From frequent digging and forking large quantities of stones were exposed. These were collected in August, and forty-seven cart loads of stones, varying in size from 2 inches in diameter to 12 inches or more, were removed and deposited outside the garden.

During April all the Loranthus parasites were weeded out from the trees and shrubs in the garden; and the shrubs and trees along the *Cupressus* avenue, the shrubbery to the north of

the herbaceous garden, also along the upper drive, and to the north-west of the flower garden were pruned during August, October, and November.

In the early part of the year much damage was caused to the young plants by the black grub, and at the end of the year many thousands of plants were destroyed by the excessive and continuous wet weather, while during March and April much watering was required on account of the dry weather.

The high winds in July and August caused considerable damage to the trees and shrubs. Several large trees were blown down, and the whole garden was strewn with branches and twigs.

The rockeries in the middle of the garden have been entirely re-made and re-planted. Many hundreds of plants lifted from the borders and from divided plants and from the nurseries have been set out in the vacancies in the shrubberies.

The long border on the bank between the upper entrance to the Fernery and the Superintendent's office was dug up and re-planted with liliaceous plants, dahlias, and chrysanthemums.

A good deal of labour was spent on the banks alongside of the path leading from the Fernery to the entrance gates, near the Eucalyptus clump, and above the ornamental pond. 3,760 pockets were made in them, filled in with good soil and manure, and planted with ferns, begonias, bulbs, and dwarf herbaceous plants. A rock bed was made on each side of the little stream below the lower entrance to the Fernery, and 2,130 assorted plants planted out in them.

The little hill above and to the south of the rustic bridge has been levelled off, the soil being used to fill the hollow below. The long bank sloping down towards the bridge has been made even and turfed, and 400 liliaceous plants have been planted in it. 750 bulbs of *Cyrtanthus Mackenii* were also planted in the grass bank opposite this. The space levelled, which measures 350 square yards, has been planted with grass from the roadsides and from the trimmings of the new turf verges, and now forms a nice piece of turf. Several trees near this, which obstructed the view from the drive, have been cut down and sawn into boards for repairs to the propagating house and for making seed boxes. This, with the removal of the hill, has opened up a very nice view over the Uva country.

The heavy rains having damaged the bank at the back of the office, a few days' labour was spent in making it even and turfing it over. The bank opposite Oak Hill on the lower drive was also filled up and re-turfed, and a bank near the Foreman's quarters, measuring together 256 square yards.

The old *Frenela* trees on the narrow bank along the upper side of the lower drive have been cut down, roots removed, and the bank levelled and planted up with trees and shrubs. Four single arches and one double arch were re-made with jungle sticks over the shrubbery paths.

In January a small retaining wall 35 feet long was built near the cattle shed. In August the retaining wall to the north-west of the office was raised to the level of the path and the hollow filled in with soil, the new wall measuring 50 feet long with an average depth of 3 feet.

The rough grass above and near by the Laboratory has been grubbed up and cleaned off, as well as the plot above the Fernery, and tree plants have been planted in it.

A trench 174 feet long, 18 inches wide, and 18 inches deep was got out above the Laboratory, filled in with good soil, and planted with *Frenela rhomboidea* to form a hedge to hide the unsightly building above.

The Eucalyptus and Pinus plantations were thoroughly cleaned up in April, and 200 assorted plants from the Nursery have been planted out in the bare places.

All the honeysuckle on the banks of the upper side of the drive from the entrance gates for a distance of 232 yards, which had become much entangled and overgrown, was cut off close to the ground and the bank cleaned up.

Coronation Trees.—The 9th August being the Coronation of His Majesty King Edward VII, sixty different kinds of trees and shrubs were planted out in well prepared sites in the plot of land below and around the laboratory—myself, my wife, and family, and the garden staff each planting a different kind of tree. These plants have all been fenced, and it is hoped will form an interesting plantation in the future.

Classified Herbaceous Garden.—Beyond the usual upkeep and supply of plants, staking, labelling, &c., very little has been done in this garden during the year. Many of the beds have become overgrown, and the plants will require to be lifted, divided, and re-planted during the coming year. At the beginning of January the edging tiles were cleaned, stone steps repaired, and the paths put in order.

A bed 32 feet long and 4 feet wide was prepared for new varieties of Amaryllis, and thirty-two varieties were planted out in it. Most of these were presented to the gardens by Mr. T. C. Huxley of Peradeniya, who has made a special study of the hybridization of this class of plants, and has raised some really fine varieties.

Rose Garden and Rose Borders.—The excessive wet weather has told seriously on the rose plants, and many that were sickly have quite died out. There was, however, a good display of blooms during the first half of the year. The spaces between the plants have been kept filled up with dwarf showy annuals, and these have flowered well all through the dry weather. The fence all round this garden, on which the creeping roses are grown, was much damaged during the early part of the south-west monsoon. New supports were put in, and temporary repairs were made.

Flower Garden.—The north-west side of the Flower Garden, which had become very uneven and difficult to keep in order, was taken in hand in October. All the plants and turf were removed, the retaining wall raised, and the whole surface made level, sandy loam from the public roadsides being carted in for this purpose. When it had settled down, the whole plot was turfed, and when this had grown together a design of twelve beds were cut out in it. The bank of either sides of the steps has been made up and re-turfed. There was a good display of flowers from the beginning of February right on to the end of May, and again in August and September.

Water Lily, &c.—*Nymphea stellata* and also *Crinum gigantea*, which succeeds well in shallow water, flowered profusely in June, and made quite a pretty show. The former plant has had a few flowers on it all through the year, and is now quite established. Chrysanthemums both in the Nursery and in pots flowered freely in June.

Boundary Fence.—The *Acacia decurrens* planted last year were attacked by porcupines in April and July, and a large number of plants were destroyed, but the majority of the plants have become established and have made fine growth, many plants being 8 to 12 feet high twelve months from planting. In September a space sufficient for another row all round, over a mile in length, was prepared, and this was planted during the remaining months of the year. Altogether 3,000 plants were set out in this belt during the year in planting the extra row and supplying.

Blackberries.—The English blackberries seem now quite at home. They have grown well, and borne a very good crop of good-sized well-flavoured fruit. They began to fruit in June, and continued to bear for several months. The treatment they require here is to be well supplied with manure, or manure water, the old shoots to be removed after fruiting, and the soil forked up around them. If treated in this way there is no reason why this fruit should not be profitably grown in all up-country gardens.

Madagascar Mango.—During April three plants of this mango were planted out above the Fernery, and three were given to Mr. A. J. Kellow to try on his Albion estate. They are all looking well, but those at Albion are by far the better plants, and although they may grow into good-sized trees I do not think they are ever likely to fruit at Hakgala.

Paspalum dilatatum.—This fodder grass has now become well established, and gives large crops of green food. It can be cut four or five times a year. The produce of two square yards cut on the 15th September, or the third cutting of the year, produced 25 lb. weight of green fodder, or at the rate of 27 tons to the acre. In really good soil I believe it would give much more. It is rather a coarse grass, and I find that horses and cattle generally do not eat it so readily as some other grasses, and where Guinea grass can be grown the latter is much preferred, both on account of its quick growth and its good feeding qualities.

Villebrunea integrifolia.—The small plot of this fibre plant has been kept supplied, and most of the plants are now growing well and look remarkably healthy. Some of them have grown shoots 6 feet long and 4 inches in circumference at the base. To show the vigour of the plants I may mention that some of the leaves, not including the leaf-stalks, are 18 inches long by 7 inches wide.

Oaks.—Several of the young oak trees flowered freely during the year, and one produced a few acorns, from which plants have been raised and planted out. The plantation of Turkey oaks has done well during the year; some of the plants are now 16 feet high, with a girth of stem at the base of 13 inches. They were all pruned at the end of the year. The Cork oak has now become acclimatized, and it is now growing vigorously. It is over 12 feet high, with a girth of 13 inches at the base, and the layer of cork bark is five-eights of an inch thick.

Casuarina Plantation.—The plot of land planted with *Casuarina montana* in 1899 was a typical piece of poor patana land, and it is interesting to note that this species has grown very well in it; some of the plants now are over 20 feet high and 10 inches in circumference at the base.

Mana Grass.—During February sixteen sacks of this scented grass were despatched to Colombo to Mr. Bamber for experiment in distillation of the oil.

Water Service.—The pipes for the distribution of water to various parts of the garden were laid by the Public Works Department in June, but it was not till September that the taps were supplied and fitted to the standpipes.

Visitors.—The number of visitors to the gardens this year was 2,194, which is the highest yet recorded, and shows an increase of 664 over that of last year. The largest number in any one month was 393 in April, against 241 of the same month of the year before. The smallest number in any month was 55 in November, against 25 in June of last year.

Meteorological.—During the dry weather in September the thermometer cages, anemometer, wind-vane, &c., were put in good order and painted, and new steps were laid leading up to the dry- and wet-bulb thermometer cage, this work being paid for by the Surveyor-General's Department.

The first half of the year was dry, being exactly 6 inches below the average for eighteen years, and 4·96 inches below that of last year, which was also a dry year. The average number of days on which rain fell during the first six months was, however, almost exactly the average, being 85, against the average of 86. January, February, and April were slightly above the average both in rainfall and number of rainy days, while March, May, and June were much below as regards rainfall, and June was 6 days behind in rainy days. June was altogether a remarkable month, both in the short rainfall and the absence of strong winds.

The second half of the year was remarkable for excessive rainfall, and more than made up for the shortage during the first half. From the 1st October to the 13th December there were only 5 rainless days, and during that period—74 days—no less than 44·44 inches of rain fell, giving an average of ·60 inches per diem. This was most trying to small seedling plants; many thousands of these were killed, and even large plants damped off in great numbers.

The total rainfall for the year was 101·04 inches on 217 days, against the average of 90·63 inches on 208 days, which is 10·41 inches of rainfall and 9 of rainy days in excess of the average of eighteen years. The wettest months were July, October, and November, which together gave a rainfall of 49·46 inches on 78 days; and the driest months this year were March, May, and June, giving a total of 10·49 inches on 37 days. The greatest fall in any 24 hours was 4·09 inches from the 22nd to the 23rd November, against 3·98 inches from the 26th to the 27th June of the year before.

The following is a record of the details of the weather for each month:—

January opened very wet, and for the first 8 days rain fell almost continually, 7·37 inches being registered during that time. The remaining part of the month, with the exceptions of heavy showers on the 18th and 27th, was very bright and fine, with cold clear nights. The temperature was very low all through the month, and frost occurred frequently a quarter of a mile above the garden gates. It has been many years since we had such weather, for although we are liable to have an occasional frost at this time of the year, it is rare to have it for three or four nights in succession, as was the case this year. The total rainfall was 8·16 inches, which fell on 12 days. This is very slightly above the average of eighteen years, but 4 less of rainy days. The pressure of the wind, as is usual during January, was very light; the direction was variable, but generally from the east and south-east.

February.—The weather during this month was very peculiar. The first 2 days were fine and hot; on the 3rd day in the afternoon heavy rain fell; this was followed by 2 more fine days, then a spell of dull, dark, foggy weather set in and lasted until the 20th, being more like December, and a great many plants damped off during this time. From the 20th to the end of the month it was very fine, with only one light shower, which fell on the 24th. The total rainfall was 4·88 inches on 13 days. This is 1·91 above the average of rainfall and 5 above the average of rainy days. Heavy rain fell on the 3rd, 11th, and 19th.

The pressure of the wind was light until the 13th, when it became moderate and varied between light and moderate for the rest of the month, with the exception of the 25th, when it blew

fairly strong from the north-east. In direction it was fairly steady from the east and south-east, except on the 13th, when it blew from the south.

March this year was unusually dry, the rainfall being only 1·65 inch on 9 days, against the average of 4·71 inches on 10 days, the shortage being no less than 3·06 inches. There was a great deal of thunder at the end of the month, and the afternoons were very hot and oppressive. There was frost at Sita Eliya, just above the gardens, on several mornings at the middle of the month, and a very sharp one on the 20th, cutting down Cannas, Heliotrope, and other tender plants quite to the ground. I do not remember to have experienced frost so late before.

The force of the wind was, as last year, very light, and the direction was steady from the east and south-east, with the exception of the 13th and 21st, when it blew lightly from the north-east.

April was very dull and wet, rain falling on no less than 23 days, heavy rains falling on the 12th, 17th to 19th, and from the 27th to the end of the month. The total rainfall was 8·85 inches on 23 days, against an average of 7·60 inches on 16 days, and double what fell last year for the same month.

With the exception of the 14th and 28th, the wind was very light all through the month, especially in the afternoons, when it was quite calm on 7 days. In direction it was the same as for March, except on the last 3 days of the month, when it veered round to the west and north-east.

May, as last year, was very dry and warm, with very little wind. The total rainfall was only 4·23 inches on 14 days, against an average of 7·40 inches on 16 days. This makes the third year that the rainfall has been considerably under the average, and one may expect a greater fall next year.

The pressure of the wind was light or moderate all through the month, with the exception of the 27th, when it blew fairly strong from the west in the early morning. The direction was variable, from east, south-west, west, and north-west, and once from the north-east, the 11th. There was, however, hardly a day but that it blew from various parts of the compass, this being very similar to what it was last year.

June this year has been remarkable, chiefly for the absence of strong winds and heavy rains. Though rain fell on 14 days, no heavy rain fell, except on the first 3 days of the month, when 3·31 inches fell out of a total for the month of only 4·61 inches. This is 3·46 inches short of the average of rainfall and 6 of rainy days. This leaves us at the end of the half-year exactly 6 inches below the average, viz., 32·43 inches, against the average of 38·43 inches. The number of days on which rain fell is almost exactly the average, viz., 85, against 86.

The pressure of the wind for June was remarkably light, much lighter than I have ever known it before, and being no less than 2,123·20 miles less than that of last year and 2,755·80 less than that of the year before. The greatest pressure registered in June was only ·460 lb. per square foot or 9·60 miles an hour, whereas last year some of the gusts were equal to a velocity of 36 miles an hour or more. In direction it was variable, but on the whole it inclined from the north-west to south-west.

July, on the whole, was very rough and wet; no less than 6·64 inches of rain fell from the 2nd to the 7th, over 1 inch a day. From the 7th to the 14th it was dull and showery, from 14th to 20th it was fine. A heavy shower fell on the evening of the 20th, followed by a very calm night. The next 2 days were calm and sultry. On the 23rd there was hardly a cloud in the sky. This and the next day were bright and fine, but the wind rose up to strong, and the last 6 days of the month were showery. The total rainfall for the month was 9·96 inches on 22 days, against an average of 5·75 inches on 17 days.

The pressure of the wind at the beginning of the month was very strong, and during the early morning of the 4th the gusts registered a velocity of 36 miles an hour. On the 19th it fell to very light, and remained so for 4 days. It then became strong again for 3 days, the next 2 days being moderate and the last 4 days strong. The direction was generally from the south-west and north-west, but on the 22nd it veered round to the north, and on several afternoons it was frequently in that direction for short intervals.

August.—As usual, this month was dry. The total rainfall being only 4·91 inches on 14 days, against the average of 4·65 inches on 18 days. Of the 4·91 inches this year, 3·73 inches fell during the first 10 days, and 2·15 inches of this fell on the 3rd and 9th. Only two very light showers, measuring ·20 parts of an inch, fell during the last 10 days of the month. This, with the high winds, dried up the ground very quickly, and the plants generally suffered very much from the drought.

The force of the wind was variable, alternating between strong, moderate, and light, until the 15th, when it blew strong, and continued so until the 20th, when it became moderate, strong again the next day, then moderate for 3 days, and strong or very strong for the rest of the month. On the morning of the 30th the gusts registered a velocity at the rate of 45 miles an hour, which is the highest recorded since the 19th June, 1895. In direction it was fairly steady from the south-west, west, and north-west.

September was very wet and dull up to the 18th (and was especially cold and rough from the 10th to 14th), rain falling on every day except the 5th. From the 18th to the 28th it was very bright and fine. Heavy rain fell, from the north-east, on the afternoons of the 28th, 29th, and 30th. The total rainfall for the month was 7·38 inches on 20 days, against an average of 5·83 on 18 days.

The pressure of the wind was strong on the 1st, then moderate to the 6th, when it fell to light. From this until the 27th it was variable, being very strong on the 9th, light on the 19th, and very light on the 24th. From the 27th to the end of the month it was light. The direction was much the same as during August, viz., from the south-west, west, and north-west, but on the 27th it blew from the east and south-east.

October this year was remarkable for excessive rainfall, and although the mornings were fairly fine, and the most of the rain falling in the afternoons and evenings, the weather was dull, and the absence of sun was much felt, the mean amount of cloud being as high as 8·0.

The total rainfall for the month was 19·46 inches on 30 days. This is no less than 8·96 inches above the average of rainfall and 8 of rainy days, and proves to be the second wettest October recorded here, the wettest being in 1891, when 22·85 inches fell on 30 days. The heaviest fall was on the 18th, when 3·28 inches fell in about 3 hours; 2·94 inches fell on the 26th, and 2·19 inches on the 22nd. The mean daily rainfall for the month was ·62 inches.

The pressure of the wind was very light all through the month, with the exception of the 29th, when, curiously, it blew moderately from the south-west. In direction it was variable, but was from the east and south-east on most days. On some days it was very unsettled, and changed from north-east to south-west very frequently; on 8 days in the afternoon it was quite calm.

November was quite the worst in my experience, and the wettest on record at this station. The excessively heavy rainfall and dull foggy sunless weather was very trying to plant life, and thousands of tender plants were killed off either by the heavy incessant rains or damped off through the close dull weather.

The total rainfall for the month was 20·04 inches on 26 days, against the average of 11 inches on 21 days. The fall this year is no less than 1·57 inch more than that of November, 1892, when 18·47 inches fell on 23 days, and which was the highest hitherto recorded here for this month.

The wind was very light all through the month, and was quite calm on 12 days at the afternoon readings. In direction it was variable, but except on the 3rd, 5th, and 28th, when it blew from the south-west, it veered between the south-east and north-west.

December.—The dull, wet, sunless weather which prevailed during the two preceding months continued until the 14th. It then cleared up, and with the exception of light showers on the 15th, 16th, and 19th, it was bright and fine until the 27th, when it turned dull and drizzly again from the north-east, and this continued until the end of the year.

The total rainfall for the month was only 6·86 inches, which fell on 20 days, against an average of 14·35 on 22 days. This proves to be the driest December since 1889, when only 5·88 inches fell on 18 days, and is the second driest on record here.

As in November, the pressure of the wind was very light all through the month. In direction it was steady from the east and south-east, being quite calm on two occasions at the morning readings and five times at the afternoon readings.

The following table shows the monthly rainfall and averages from July, 1883, to the end of 1902, and the number of days on which rain fell during the 21 years 1882 to 1902, inclusive:—

		Jan.	Feb.	March.	April.	May.	June.	July.	Aug.	Sept.	Oct.	Nov.	Dec.	Total.
1902	Rainfall ...	8·61	4·48	1·65	8·85	4·23	4·61	9·96	4·91	7·38	19·46	20·04	6·86	101·04
	Days ...	12	13	9	23	14	14	22	14	20	30	26	22	217

* Rainfall of half a year.

† Average of 21 years.

‡ Average of 19 years January to June, and 20 years July to December.

§ Average of 19 years.

The greatest pressure of the wind during the year was 10·125 lb. per square foot on the morning of the 30th August, equalling a velocity of 45 miles an hour, against 6·840 lb. or 36 miles an hour of the 5th June last year. The pressure registered on 30th August this year is the highest since the 19th June, 1895, when a like pressure was recorded.

The mean daily horizontal movement of the air for the year was 69·16 miles, against 84·85 miles of the year before. This shows that the pressure of the wind was much less this than last year, and last year was also less than the year before that, viz., 1900, when the mean daily horizontal movement of the air was as high as 90·88 miles.

The windiest month this year was July, with a mean daily horizontal movement of 176·67 miles, against 185·60 miles of the month of June last year.

Two new almirahs have been purchased. One has been fitted into the space below the private staircase, and the other is temporarily placed in the Director's Office for the reception of the duplicate collection of Lepidoptera, including the bulk of the Pole collection purchased in 1900. New shelving has also been added to the Director's Office and to the Taxidermist's room. A well-fitted cabinet containing a portion of the Collett collection of Land Mollusca was purchased with the collection (see below, No. 14). A new second class latrine has been erected in the grounds on special estimate.

5.—REGISTER.

A new register of the objects contained in the Museum has been commenced, with the object of facilitating reference by rendering the register marks permanent. When complete it will supersede the older registers, in which the numbers of the objects have suffered periodic changes.

6.—PUBLICATIONS.

The Moth Catalogue was compiled by Mr. Haly, but only the first part was printed under his supervision. The manuscript of the remainder has now been set up, and Mr. F. M. Mackwood has kindly undertaken the task of revision and addition of fresh entries, with the assistance, as he informs me, of Mr. E. E. Green and Mr. John Pole. The Coin Catalogue awaits revision by the Archæological Commissioner. A Guide to the Museum for the use of visitors is still a desideratum, and it may not be possible to issue one for some time to come pending re-arrangement of specimens.

The experimental issue of a Museum publication in the form of an illustrated quarterly journal, entitled "Spolia Zeylanica," has been authorized for the year 1903. It is intended that it shall contain contributions, records, and observations, together with notes, abstracts, and reviews, relating to the economic and systematic knowledge of the natural resources (Zoology, Anthropology, Palæontology) of the Island and of the surrounding seas.

7.—GROUNDS.

N. P. Jusey Appu, Head Gardener, retired after twenty-one years' service, and was succeeded by N. P. Peduru Appu.

A few new beds have been laid out at the back of the building; new tubs for roses, a lawn mower, and a scythe have been purchased; and the fernery shed has been repaired. A couple of bricks with the names of trees painted upon them have been received from the Royal Botanic Gardens, Peradeniya.

A rambutan sapling (*Nephelium lappaceum*) has been planted as a Coronation tree. A young durian tree was subject to the nocturnal depredations of injurious insects, which devoured the leaves. The gardener informs me that he placed a nest of red fighting ants in the tree, and the visitations ceased.

8.—TRANSPORTATION OF CROWS TO PENANG.

At the request of the Resident-General, Federated Malay States, at Selangor, an experimental consignment of gray crows in three large cases was despatched by the Austrian Lloyd ss. Austria to Penang on December 28, with the Taxidermist of the Museum, Mr. H. F. Fernando, in charge.

The result of this attempt at acclimatization is awaited with interest. The crows were chiefly obtained from Crow Island through the influence of Dr. W. H. Meier, Superintendent of the Leper Asylum, in response to a request addressed to him, in the first instance, by Mr. G. A. Joseph, and were kept in cages at the Museum and tended daily for two months until the time of their departure. Deaths occurred almost every day during their confinement, but it is hoped that a sufficient number will reach their destination alive to render the experiment complete.

9.—PREPARATION AND PRESERVATION OF NATURAL HISTORY SPECIMENS.

On July 23 Commandant Paul Krantz, Prisoner of War on parole, came to the Museum and offered his services in mounting and re-mounting specimens of natural history at a salary of Rs. 300 a month for a period of three months. The offer was accepted under the authority of Government, and the Museum Taxidermist, Mr. H. F. Fernando, was able to enjoy the advantages of European experience without the expense of a journey to Europe. A. van der Zyl was engaged as assistant to the Taxidermist.

A fresh supply of glassware for the preservation of material in spirits has been purchased to replenish the almost exhausted stock.

A dozen new insect boxes for Lepidoptera, two cases of peat for constructing artificial environments for groups and for other purposes, a set of glass eyes, and an egg-boring apparatus have been bought.

A microscope, the property of the late Mr. Oliver Collett, with bent tube provided with an erecting prism suitable for the examination and dissection of small organisms, has been purchased by special grant of Rs. 150.

10.—MAMMALS.

A group representing a buck of the spotted deer attacked by a leopard, with a fawn looking on, has been mounted and placed on exhibition. The material was obtained during a Museum expedition to the Hambantota District, and the specimens fell to the gun of Commandant Krantz. The group is not yet completed, as it is intended to mount some black-faced monkeys on a tree grinning with rage at the prowess of their mortal enemy the leopard. Monkey's hair was found in the leopard's stomach. Unfortunately, the skins of monkeys which had been prepared for the purpose of this group came to grief in the brine bath, a prolonged sojourn in which is not to be recommended for this climate. The general idea of the group, when completed, will be to illustrate the grace and fleetness of the herbivora in contrast with the craft and ferocity of the carnivora, the whole being dominated by the genius of the quadrumana.

The collection of mammalian skulls in the Museum is not what it should be, and a commencement has been made to fill up the gaps.

A female mouse-deer (*Tragulus meminna*) was shot by the Taxidermist at Ranna in the act of being attacked by a jackal. The mouse-deer had been previouly disabled by a compound fracture of one of the hind limbs. A young male otter (*Lutra nair*) caught in the Colombo lake was purchased. Two specimens of the Ceylon hare (*Lepus nigricollis*) have been obtained as a commencement of a

series of skins and skulls of this species, in order to ascertain whether or not it is specifically or racially distinct from the Indian hare. An antelope-rat (*Gerbillus indicus*, "Welimiya") was dug out of its burrow in the Museum grounds at the back of the building. Two kinds of bats were obtained from the old fort at Kalpitiya, namely, the fulvous fruit bat (*Xantharpyia amplexicaudata*), male, female, and young, and Schneider's leaf-nosed bat (*Hipposiderus speoris*), males only.

Other additions to the collection of mammals are recorded under the heading "Donations."

11.—BIRDS.

The contents of the eagle case have been re-arranged, and some of the eagles have been re-mounted in the form of a group disposed upon and about a branching trunk. The group includes representatives of the following species :—

14. Spizaëtus kelaarti, the Ceylon Mountain Hawk Eagle. Two specimens were relaxed and re-mounted.
15. Spizaëtus cirratus, Ceylon Hawk Eagle. Two specimens relaxed and re-mounted.
16. Spilornis cheela, Ceylon Serpent Eagle. Two specimens relaxed and re-mounted.
12. Lophotriorchis kieneri, Rufous-bellied Hawk Eagle. Two specimens relaxed and re-mounted.
19. Haliastur indus, the Brahminy Kite. One specimen relaxed and re-mounted, and a young male purchased and mounted.
17. Haliætus leucogaster, the White-bellied Sea Eagle. One male specimen collected at Wirawila and mounted.

Fresh specimens of the following birds have been mounted :—

33. Scops bakkamuna, Forster's Scops Owl, from Colombo.
305. Sterna bergi, the Large-crested Tern, from Negombo.
248. Amaurornis phœnicurus, the White-breasted Water-hen, from Boralasgama.
215. Acridotheres melanosternus, the Ceylonese Myna, from Horana.
108. Pericrocotus flammeus, the Orange Minivet, from Horana.

12.—REPTILES AND FISHES.

Numerous specimens of snakes have been sent to the Museum for identification, and several have been presented. A "tic-polonga" (*Vipera russelli*) has been mummified, and will be placed on exhibition.

Some attention has been given to the fishes of the Colombo lake, where marine and fresh water species exist in company. In course of time it is hoped that a revision of the fresh water fishes of Ceylon will be carried out.

13.—INVERTEBRATES.

The collection of Lepidoptera (moths and butterflies) receives constant additions, and the kind assistance of the Government Entomologist will doubtless facilitate the proper arrangement of the material. The method at present adopted in the exhibition of the Lepidoptera of Ceylon does not fulfil the recognized requirements for this order of insects. They should not be placed in exposed cases, but should be kept in cabinets provided with glazed drawers, which could be pulled out in succession by visitors interested in this branch of Zoology. This is the way in which Lord Walsingham's collection of British Lepidoptera is exhibited in the Natural History Museum at South Kensington. There is ample room underneath the existing cases of insects for fitting up such cabinets, and I hope the new system will soon be inaugurated. Under present conditions the exhibited specimens tend to deteriorate more rapidly than would otherwise happen. Moreover, a considerable amount of space for the exhibition of other material which abounds would thereby be rendered available for use.

Small collections of Crustacea have been sent to Dr. Paul Mayer at the Stazione Zoologica, Naples, and to the Rev. T. R. R. Stebbing, F.R.S., in England, for identification. A small crustacean species dredged up in the neighbourhood of Dutch Bay has been identified by Dr. Mayer as *Metaprotella sandalensis*, a species which was first obtained by me in Sandal Bay, Lifu, one of the Loyalty Islands.

A collection of Homopterous insects has been sent for determination to Dr. L. Melichar in Vienna at the instance of Dr. H. Uzel, who worked for a month in the Museum.

Collections of parasitic worms (*Trematoda*, *Cestoda*, *Acanthocephala*, &c.) taken from the stomach and intestine of the wild boar, spotted deer, leopard, python, tic-polonga, peacock, &c., have been sent to Mr. A. E. Shipley at Christ's College, Cambridge.

14.—COLLETT COLLECTION OF LAND MOLLUSCA.

The valuable collection of Ceylon Land Mollusca brought together by the late Mr. Oliver Collett of Binoya has been acquired by purchase for the Colombo Museum for Rs. 2,000.

The Museum has on former occasions derived benefit from Mr. Collett's special knowledge and generosity, and it is a matter for congratulation, if it may be considered apart from the melancholy circumstance to which it is due, that such a collection, which always represents far more work than appears on the surface, remains intact in the Colony.

The collection includes dry shells in a cabinet, material preserved whole in spirits, many of the specimens being beautifully extended as in life owing to a special method of preparation adopted by Mr. Collett; finally, a set of microscopic preparations of the tongues or lingual ribbons of many of the species mounted permanently on slides in Canada balsam and preserved in a special slide case.

15.—DOMESTIC ART AND CURRENCY.

Several Dutch betel boxes, calamander jewellery boxes, chunam boxes, coins, and personal ornaments have been added to the collection by purchase.

Among the more notable acquisitions by purchase may be mentioned an old Kandyan knife richly mounted in silver and brass with a scroll pattern differing from any other in the Museum, a carved calamander cocoanut scraper, a board for playing the game called *chonka*, a heavy brass jewel box, &c.

16.—ACCOMMODATION.

The extension of the Museum, which was sanctioned by Government in 1893, has not been effected owing to the introduction of conflicting plans.

With the carrying out of certain ideas for the exhibition of specimens, the mounting of groups, the formation of an index collection, the display of antiquities, and the growth of the Library, the

OLA MANUSCRIPTS.

169 manuscripts were consulted in the Library.

Saratthappakasani, Commentary on the Sanyutta Nikaya of the Sutta Pitaka, was transcribed for the Library.

The following works have been transcribed for the Oriental Library under the supervision of the Archæological Commissioner :—

Sarattha Dipani : Commentary on the first of the five divisions which comprise the Vinaya Pitaka. It is a rare and valuable acquisition.
Yasodaravata : Life of Yasodara Devi, wife of Prince Siddharta.
Maliyadeve Kathava : Discourse of the future Maitri Buddha, with a Rahat at Tavtisa Divyaloka.
Dharmassravanapunnayanumodanava : Offer by priests of a share of the merit (anumodankaranava) after preaching *bana*.
Dasadanavastuva : The ten modes of giving alms, and instancing Vessantara Raja's action.
Elu-sloka Satakaya : In praise of the Buddha's good actions. Elu-slokas with Sanne.
Yamakappratihargiya Satakaya : Account of a miracle wrought by the Buddha at Sevat Nuvara.
Budugunavarnanava : In praise of the Buddha's good actions.

The following works were acquired by purchase :—

Nakshatrapota : An astrological work. 182 leaves, 5 in. long, 9 lines to a page.
Kavyasekara : Sinhalese Poetical Version of the Senakajataka, by Sri Rahula Thera. 69 leaves, 15 in. long, 4 lines to a page.
Kavyasekara Sanne : Paraphrase of the above work. 217 leaves, 18 in. long, 5 lines to a page.

A reader had a transcript of Simasankara Vinodani made from the copy in the Library.

CATALOGUES.

Part II., Printed Books.—Owing to other urgent demands the Government Printer was not able to devote much time this year to the printing of this subject catalogue. Towards the close of the year some proof was received.

On my suggestion the Government sanctioned the sale of the Library Catalogues at the following prices :—

	Rs. c.
Catalogue of Printed Books	1 0
Catalogue of Printed Books, Supplement No. 1	0 75
Catalogue of Printed Books, Supplement No. 2	0 75
Catalogue of Pali, Sinhalese, and Sanskrit Manuscripts	0 75

[Index to Sessional Papers, 1855–1894, extracted from the Museum Library Catalogue, is also sold at the Record Office for 35 cents.]

The catalogues can be obtained from the Government Record Office or at the Museum. Applications were received from booksellers in Europe and others for copies of our catalogues, so it has been decided to sell them, retaining a few for general distribution to other Libraries.

The Catalogue of Ola Manuscripts compiled by Mr. Gunasekere, the Assistant Librarian, has been very highly spoken of, and was often applied for by booksellers and others in Europe. The British Museum authorities applied for an extra copy.

CONCLUSION.

The Library contains more than 6,000 volumes,* of which there are printed catalogues. In the arrangement and cataloguing of the books ready accessibility has been the first consideration, so that a reader may be able to glean the information which he seeks with the smallest possible outlay of trouble and least waste of time.

The special characteristics of the Library are an unrivalled collection of Ceylon literature (Historical, Archæological, &c.); a very good collection of books on Biology; a most valuable collection of ola manuscripts in Sinhalese, Pali, and Sanskrit; books of reference, such as Dictionaries, Encyclopædias, Journals, and books of Travel, Art, Philology, and Religion.

It is to be hoped that, with more accommodation shortly to be given, our votes will be suitably increased, and that the Library will be enabled to render itself increasingly serviceable to students and the general public.

GERARD A. JOSEPH,
Secretary and Librarian.

Colombo Museum, January 1, 1903.

* Exclusive of the books in the Library of the C.B.R.A.S.

COLOMBO HARBOUR WORKS.

REPORT OF THE RESIDENT ENGINEER FOR 1902.

MAINTENANCE.

South-West Breakwater.—During the early part of the year levels were taken over the whole surface of the Breakwater and showed very little settlement. The soundings taken on the seaside showed the places where rubble was required. The amount deposited amounted to 1,402 tons.

Bed of Harbour.—The whole of the harbour was also sounded over and the figures tabulated. The result was satisfactory, there being little or no sign of shoaling.

Dredging.—The total quantity of material removed from the harbour and taken to sea amounted to 446,875 cubic yards. Of this quantity, the "Sir John Coode" accounted for 272,400 cubic yards, the remaining 174,475 cubic yards being taken by the "Triton." The number of days during which each vessel was actually dredging was 232 and 225 respectively. The number of days the vessels were storm-stayed was 5, and the remaining working days were occupied by repairs and renewals of working parts.

Moorings.—There are now thirty-nine mooring buoys in the harbour, all of which are attached to four iron screw piles going 9 feet into the ground. Three sets more are on the spot, and will be put down as soon as an opportunity offers, while twelve new sets are on order. The total number of buoys will be fifty-three when the harbour is complete.

Inner Harbour Dredging.—The "Priestman" digger raised 21,320 cubic yards during the year, of which 14,900 tons were sold as ballast, and the remainder deposited at the reclamation ground.

HARBOUR EXTENSION WORKS.

Blockyard.—The number of blocks made for the North-West Breakwater was 2,457, weighing over 51,000 tons. The materials used in their construction were as under :—

Broken metal	30,000 tons
Sand	15,000 „
Cement...	30,000 casks

In addition to the above, 421 concrete cylinder rings were made for the new coaling jetties.

Patent Slip.—The patent slip was practically completed at the end of December, and the "Triton" was taken up on the 6th January, 1903, and launched on the 27th idem. The "Sir John Coode," which is the largest vessel the slip is capable of dealing with, was drawn up on the 2nd February and launched on the 2nd March. The "Lady Havelock" and the "Said" have also been dealt with. It is anticipated that the slip will be kept fully employed. Applications for its use have already been received from the agents of five steamers.

New Coal Depôt.—The reclamation of the land forming the new coal depôt was carried out uninterruptedly during the year. The area reclaimed amounted to 4 acres, leaving 8 acres still to be carried out, the total area of the proposed coaling ground being 24 acres.

Jetties.—The eighteen new jetties sanctioned last year have been put in hand, a start having been made before the close of the year.

Boat Basin.—The completion of this work was put in hand concurrently with the jetties above-mentioned. Both of these works will be pushed on the arrival of the necessary plant, which has been ordered from England.

Mahara Quarry.—The quantity of rubble sent to Colombo from this quarry during the year was 63,141 tons 2 cwt. :—

	Tons.	cwt.		Tons.	cwt.
January	6,237	6	September	5,304	0
February	5,293	16	October	5,202	0
March	5,441	14	November	4,906	4
April	5,288	14	December	4,692	0
May	5,263	4			
June	4,399	6	Total ...	63,141	2
July	6,012	18			
August	5,100	0			

This rubble was disposed of as under :—

	Tons.	cwt.
Mound, North-West Breakwater	7,827	14
Concrete material, blocks and cylinders, North-West Breakwater and Coal Jetties	23,814	6
Founds, Patent Slip	693	0
Pitching, Coal Depôt	867	0
Concrete material, Graving Dock	21,693	14
Stone for dressing, Graving Dock	1,821	8
Stone dressed in quarry	395	16
Protection berm, Graving Dock	1,560	12
Rubble sold to other departments, &c.	4,467	12
Total ...	63,141	2

The convict labour employed during the year was 131,019, or a daily average of 421 :—

January	10,754	September	11,608
February	9,957½	October	11,172½
March	10,358½	November	10,452½
April	11,223½	December	10,730
May	11,804		
June	10,437½	Total ...	131,019
July	11,187½		
August	11,333½		

There was in addition to this convict labour a daily average of 16 free labour employed, working locomotives, cranes, &c.

Mutwal Quarry.—The output of stone from this quarry during the first three months of the year principally consisted of material required in the construction of the North-West Breakwater, as also during the latter months ; whereas during the period intervening the requirements of the North-East Breakwater Extension were supplied. The face of the quarry more or less maintains its depth, but the number of backs and fissures prevent any stones of good size suitable for stone dressing from being obtained, and as the nature of the stone varies considerably most of it is totally unfit for anything else than rubble. A small quantity of pitching has been prepared in this quarry, but when the excellent stone for this work now obtainable at Mahara is taken into consideration, the cost of dressing at Mutwal becomes prohibitive. The rubble for the hand stone breakers employed throughout the year at the root of the North-East Breakwater was also supplied from Mutwal. The quantity of rubble received from Mutwal quarry was 71,075 tons 5 cwt. :—

	Tons.	cwt.		Tons.	cwt.
January	9,431	15	September	4,372	8
February	9,580	2	October	2,841	18
March	7,926	19	November	2,626	14
April	4,537	13	December	3,719	1
May	7,701	4			
June	6,375	1	Total ...	71,075	5
July	6,788	19			
August	5,173	11			

which was distributed as under :—

	Tons.	cwt.
Embankment, North-East Breakwater	21,882	12
Mounds, North-West Breakwater	24,631	17
Concrete material for blocks, &c., North-West Breakwater ...	15,820	3
Founds, Patent Slip	1,133	7
Embankment, &c., Coal Depôt	1,952	19
Concrete material, Graving Dock	4,323	12
Protection berm, Graving Dock	1,274	9
Rubble for stone-dressing, Graving Dock	56	6
Total ...	71,075	5

The convict labour employed in the quarry was 67,057½, or a daily average of 215 :—

January	7,127	September	3,424½
February	5,635	October	4,402½
March	6,001½	November	4,657
April	6,318½	December	5,487
May	6,775		
June	6,081	Total ...	67,057½
July	6,476		
August	4,672½		

North-West Breakwater.—The length of the Breakwater set at the close of last year was 1,275 lineal feet, and by the 27th March, when the season's block-setting ceased, 477 lineal feet had been added, making a total of 1,752 lineal feet. The same procedure was then adopted as heretofore to ensure, as much as possible, the safety of the work from the oncoming south-west monsoon, and all block-setting operations were suspended until the 3rd November, when they were re-commenced and continued without interruption until the end of the year, when the length of the Breakwater had been increased to 2,010 lineal feet, making the progress for the year 735 lineal feet, as compared with 576 lineal feet last year.

It is interesting to note that the present monsoon has been much more satisfactory from a working point of view than the corresponding one last year, not one shift of work having been lost this year, whereas last year it was impossible to approach the Breakwater for days together owing to the seas which broke over it.

It is again with great pleasure that I am able to report that the Breakwater maintains its reputation for stability, no settlement cracks being visible throughout the whole of its length of two-fifths of a mile, which, as I have before stated, augurs well for the future existence of this valuable engineering structure, and is a satisfactory evidence of careful and solid construction.

North-East Breakwater.—In the early part of the year it was decided to reduce the opening between the North-East Breakwater and the Northern Arm, which had been left at 800 feet, for the purpose of ascertaining what width would be most desirable in the best interests of the harbour, to 700 feet, which decision necessitated the extension of the North-East Breakwater by 100 feet, and immediately upon the cessation of working operations on the North-West Breakwater this work was put in hand, and at the end of October was completed, 21,882 tons of rubble having been deposited in the extension of the berm.

GRAVING DOCK.

Cofferdam.—The cofferdam continues to be satisfactory, and has been maintained in a thoroughly watertight condition.

Dock Walls.—By 17th February about 100 feet of south wall trench was excavated to a suitable rock foundation; and the building of the wall was commenced. On 22nd May the building of the north wall was commenced on a length of about 90 feet, which was excavated to the required depth. Including the 100 feet extension authorized in December and the portions of guide piers within the cofferdam, there is a total length of 1,856 feet of trench required for dock walls, of which 1,165 feet have been excavated to a suitable foundation, and the walls built up to an average level of about 14 feet below low water ordinary spring tide (*i.e.*, a height of 24 feet 6 inches above the minimum foundation level), ranging from 2 feet below low water ordinary spring tide at the entrance to 33 feet below low water ordinary spring tide. At the east end the excavation of a further length of trench of about 431 feet is well in hand, which only leaves 260 feet of new trench to be undertaken.

During the year 34,630 cubic yards have been excavated in the soft and 12,754 cubic yards in rock in timbered trenches for walls below low water ordinary spring tide. The total amounts of excavations up to the end of the year being—

149,019 cubic yards of soft above low water ordinary spring tide.
63,844 cubic yards of soft in timbered trenches below low water ordinary spring tide.
13,799 cubic yards of rock in timbered trenches below low water ordinary spring tide.

226,662 cubic yards total excavations to 31st December, 1902.

Concreting.—Since February; when concreting was commenced, 21,559 cubic yards of concrete have been deposited in side walls of dock entrance, north guide-pier, and south jetty.

Stone-dressing.—The stone-dressing for dock has been carried on at Mahara with a monthly average of 94 prisoners, and at Kochchikada with a monthly average of 77 free stone masons. Altogether during the year 24,424 cubic feet of gneiss have been dressed and 756 square yards of pitching made. The total amounts of stone dressed and set are as under :—

	Total to 31st December, 1902. Cubic Feet.	Amount set. Cubic Feet.
Dressed granite received from England	13,996 ...	7,872
Gneiss dressed at Mahara and Kochchikada	58,220 ...	31,954
Concrete facing blocks made at dock	34,722 ...	5,344
Total ...	106,938	45,170

Stone-breaking.—7,714 cubic yards of stone have been broken by the crusher at dock and 13,515 cubic feet by hand during the year, making a total up to 31st December of 40,549 cubic yards.

Plant and Temporary Buildings.—All machinery and plant have been kept in good working order and all buildings in thorough repair.

Obituary.—It is with deep regret that I have to record the sad death, from enteric, of the late Mr. A. J. Linnell, Assistant Engineer on the Graving Dock, which took place on the 21st January, 1902.

Health of Staff.—With the above exception, the health of the staff has been good.

Expenditure.—The expenditure for the year amounted to Rs. 2,651,119·88, as under :—

	Rs. c.	Rs. c.
Upkeep of South-West Breakwater, Inner Harbour, dredging	—	96,772 84
Harbour improvements, dredging, and moorings ...	219.760 67	
New works at Customs, acquisition of land, &c. ...	427,664 56	
		647,425 23
Harbour Extension Works, Graving Dock	—	1,906,921 81
		2,651,119 88

The total expenditure on Harbour Extension Works, Graving Dock, &c., to 31st December, 1902, is—

	Rs.	c.
Harbour Extension Works, North-East and North-West Breakwaters, Reclamation, Coal Depôt, Patent Slip, Barge Repairing Basin, Coal Jetties	6,725,146	40
Stock of plant, stores, &c., at 31st December, 1902, for Harbour Extension Works, &c.	1,579,098	86
Removal of workyard from Galle Buck to Reclamation, building block jetty, &c.	1,049,802	43
Graving Dock	2,416,612	51
Graving Dock plant	552,801	11
Total Expenditure to 31st December, 1902	12,323,461	31
Grand Total Expenditure from commencement of South-West Breakwater in 1873 to 31st December, 1902	28,138,760	3

Harbour Works Office,
Colombo, March 25, 1903.

J. H. BOSTOCK,
Resident Engineer.

VETERINARY.

REPORT OF THE GOVERNMENT VETERINARY SURGEON FOR 1902.

I HAVE the honour to present my report for 1902.

I.—CONTAGIOUS AND INFECTIOUS DISEASES OF CATTLE.

Throughout the year there was comparatively little cattle disease of a contagious or an infectious nature.

The following statement, made up to January, 1903, shows briefly the outbreaks in each Province :—

Statement showing Outbreaks of Murrain and Foot-and-Mouth Diseases of Cattle for 1902.

Province.	Approximate Number of Cattle.	Outbreaks of Contagious Disease.	Number diseased.	Deaths.	Recoveries.	Balance Ill.
Western ...	192,989	Remained free all the year until the middle of December, when hoof-and-mouth disease appeared	144	—	46	98
			Town 42	—	—	42
		No rinderpest during the year*	—	—	—	—
Central ...	96,895	In January an outbreak of hoof-and-mouth disease occurred, and was suppressed	12	—	12	—
		February, March, and April free	—	—	—	—
		In May, June, and July hoof-and-mouth disease again occurred in Hatton and Dikoya, and was suppressed	58	—	58	—
		August, September, and October free	—	—	—	—
		In November and December foot-and-mouth disease again broke out, extensively in Hatton and Dikoya	136	2	134	—
		No rinderpest during the year*	—	—	—	—
Northern ...	219,629	Remained free all year, except an outbreak in September of either anthrax or a form of blood poisoning, rapidly fatal ; was suppressed	93	86	7	—
Southern ...	189,643	In February and March hoof-and-mouth disease ; suppressed	174	2	172	—
		In April eight deaths occurred from suspected rinderpest ; suppressed	8	8	—	—
		Free for rest of the year ...	—	—	—	—
Eastern ...	95,816	None until November, when an outbreak of anthrax or blood poisoning, then prevalent in North-Central Province, occurred in several adjoining villages of the Eastern Province on north-west border of Province ; suppressed. Assistant Government Agent, Trincomalee, reports on January 12, 1903, cattle in good health	28	28	—	—

* At date 19th January, 1903.

Statement showing Outbreaks of Murrain—*continued.*

Province.	Approximate Number of Cattle.	Outbreaks of Contagious Diseases.	Number diseased.	Deaths.	Recoveries.	Balance Ill.
North-Western ...	307,831	Remained free all the year	—	—	—	—
		Two cases of suspected foot-and-mouth disease in Nov.; suppressed	—	—	—	—
North-Central ...	146,318	In February hoof-and-mouth disease occurred	26	—	—	—
		In April hoof-and-mouth disease	9	—	—	—
		May free	—	—	—	—
		In June hoof-and-mouth disease	30	—	—	—
		In July do. ...	64	—	—	—
		In August do. ...	11	—	—	—
		September free ...	—	—	—	—
		In October hoof-and-mouth disease	7	—	—	—
		In December do. ...	54	—	—	—
			201	16	185	—
		In October and November a very fatal outbreak of anthrax or blood poisoning occurred; rapidly fatal	135	126	9	—
Sabaragamuwa ...	78,422	Rinderpest occurred through the first half of the year, and was suppressed by July	120	108	12	—
		In January and February hoof-and-mouth disease occurred	48	—	48	—
Uva	70,666	No reports during the year.	—	—	—	—
Total for the Island ...	1,398,209	—	1,199.	376	683	140

The outbreaks have been mostly foot-and-mouth disease; there has been very little rinderpest throughout the year.

In April eight cases of suspected rinderpest occurred in the Southern Province; all fatal. All preventive measures were adopted, and there were no more cases.

Rinderpest was prevalent in the Province of Sabaragamuwa during the first half of the year, and it was not until July that the disease was suppressed. There were 120 cases, 108 deaths and 12 recoveries.

In October and November an outbreak of what was either a form of rinderpest or a similar disease known as "hæmorrhagic septicæmia" occurred in the North-Central Province and on the border of the Eastern Province and Northern Province. It was extremely fatal. In the North-Central Province 135 cases, 126 deaths and 9 recoveries; in the Eastern Province 28 cases and 28 deaths; in the Northern Province 93 cases, 86 deaths and 7 recoveries. Strict measures of isolation, disinfection, and burial of carcases were adopted by the Stock Inspectors, and the outbreaks checked.

Hæmorrhagic Septicæmia (described by Blin and Carowgean in Indo-China).—The symptoms of this disease closely resemble those of rinderpest. They develop suddenly: there is fever, quickened respiration, dullness, loss of appetite, discharge from nostrils (at first thin, afterwards becoming thick and yellowish in colour), tears flow from the eyes, and the skin around and under the eyes may become sore, diarrhœa occurs becoming dysenteric, cough is usually present. The rate of mortality is great. It appears to be most severe in buffaloes.

In the cases in the North-Central Province swelling of the throat was described by the Inspector, and numbers of wild animals and a horse or two showing œdematous swellings died, which leads to the conclusion that the disease was not true rinderpest. It is hard to distinguish from rinderpest, but there are a few points which may help to diagnose. It usually attacks buffaloes more than other cattle; it does not become so widespread as rinderpest; the outbreaks are usually of a sporadic form sooner than epidemic; and there may be soft kind of dropsical swellings (œdematous) usually in the loose skin under the throat and neck.

The post-mortem symptoms are much the same as rinderpest, the main difference described being the pulmonary lesions. In rinderpest the lungs are usually whither than normal and spongy (but congestion may be present). In hæmorrhagic septicæmia congestion is described in red brown patches surrounded with infiltration of serum, these may be collections of pus in the lung tissue, and if of some standing the pus may be in a state of caseification. In both diseases the bronchial tubes may be congested and ulcerated, with deposits of lymph. The lesions in the digestive tract are much the same in both diseases.

The measures of prevention and suppression are the same in both diseases.

Cattle Returns for 1902.

	307,831		4,844				

The total number of cattle for the whole Island is 1,398,209, and the number of deaths reported from all diseases 9,237, giving a percentage of ·6 per cent.

II.—STAFF.

During the year the arrangement of the staff was as follows :—

Assistant Veterinary Surgeon.

Mr. E. T. Hoole, Central Province.

Stock Inspectors.

Western Province ...	...	P. C. J. Fernando. A. M. Ahamat.
Northern Province ...	...	T. Mahamooth.
Southern Province ...	...	E. W. Jayatilaka.
North-Western Province	...	M. D. Wijayanayeka.
North-Central Province	...	D. L. Dias.
Province of Sabaragamuwa	...	A. M. Fernando.

Mr. Hoole, Assistant Veterinary Surgeon, Kandy.

During the year Mr. Hoole has been working in the Central Province, and has been busily employed with foot-and-mouth disease, especially in the Hatton district, where in May, June, and July, and again in December the disease was very extensive. He was most successful in his treatment of cases, and the outbreaks were kept well in check. The number of cases which came under his notice was 328. Of these, 309 were cases of hoof-and-mouth disease, 7 cases of acute rheumatism, and 9 cases of a disease resembling anthrax ; out of these there were 3 deaths, and the remainder recovered.

The Province has been free from rinderpest during the year. No outbreaks of disease were reported from the Matale and Nuwara Eliya Districts. During the year he visited 126 villages, and travelled 1,547 miles.

The assistance rendered by the police and sanitary officer in the Hatton district is gratefully acknowledged.

Mr. D. L. Dias ; Anuradhapura.

During the year the diseases met with were anthrax, colic, fractures, foot-and-mouth disease, rinderpest, sore neck, scour, worm complaints, and wounds. Of the disease thought to be a form of anthrax, which appeared in October and November in the Province and on the borders of the Eastern Province, there were 121 cases, 106 died before reports arrived, and the Inspector got to the infected villages. Buffaloes were principally attacked. Of the remaining cases, 8 recovered and 7 died. On the border of the Eastern Province, in the Trincomalee District, 28 cases occurred, and all died, 24 of which were buffaloes. All precautions were adopted, and he was successful in checking the disease. The disease is probably more a form of hæmorrhagic septicæmia than anthrax. Diagnosis is not easy owing to the difficulty in microscopic investigations in such remote villages. In future efforts will be made to get specimens of blood sent for examination for anthrax.

Foot-and-Mouth Disease appeared in February, April, June, July, August, October, and December. There were 198 cases, and all recovered. The outbreaks were in all instances checked.

Rinderpest was reported in the Karachchi district of the Northern Province in October, and Mr. Dias was immediately sent to the spot. It was nearly confined to native cattle: there were 93 cases, 86 of which were fatal, 7 recovered. All measures of suppression were adopted, and the outbreak subsided in fifteen days.

Castration of Cattle.—In the latter end of the year Mr. Dias and myself castrated thirty head of cattle, in order to introduce the operation to the cattle owners. All were successful. After instruments are provided the Inspector will be able to go on with the work. He visited 126 villages and travelled 2,201 miles during the year.

Mr. A. M. Fernando, Ratnapura.

From January to August he was stationed at Kurunegala, and was transferred, on account of ill-health, to Ratnapura in August. From January to August the North-Western Province was free from disease, and in the latter part of the year the Province of Sabaragamuwa was free from disease. In the first half of the year there were 144 cases of rinderpest in the Province, with 20 recoveries. Inoculation was only permitted in six cases. The outbreak was looked after by Mr. Wijayanayeka, with the assistance of Ratemahatmayas and local headmen, and was successfully suppressed by July.

There were 99 cases of foot-and-mouth disease during February and March; 98 recovered; the outbreak was suppresssd. These cases also occurred during the time Mr. Wijayanayeka was stationed in the Province.

Mr. Fernando inspected the "galas" on the principal roads periodically during the year. He inspected 21 villages and travelled 262 miles.

Mr. T. Mahamooth, Jaffna.

His principal work has been in connection with the horse-breeding establishment on Delft and Iranativu.

In January he accompanied me to the islands and assisted in the work. In February he again visited the islands and reported upon the condition of the horses, especially those that were operated upon at the time of my visit. He accompanied the Government Agent to the islands in April, when 13 foals were taken from Delft to Iranativu, and five young fillies were sent back from Iranativu to Delft to join the stud.

In June he again visited Delft, and from 13th August to 12th October he was stationed on Iranativu for the purpose of observing any cases of illness, which in former years usually occurred about that time, and during that time Mr. Wright of Péradeniya visited the island for the purpose of studying the grasses and plants, and to find out if any were of a poisonous nature; fortunately no cases occurred.

On 17th October he again went to Delft, as several foals were reported to be dying, which was due to drought, the mares not having sufficient milk for the foals owing to the great scarcity of grass.

In November he again accompanied me to Delft and Iranativu and assisted me in the usual work.

The Province was free from cattle disease, except the outbreak of murrain in the Karachi district, attended to by the Stock Inspector, Anuradhapura, Mr. Dias—93 cases, 86 deaths, 7 recoveries—which was suppressed in less than a month.

Mr. M. D. S. A. Wijayanayeka, Kurunegala.

During the first half of the year he worked in the Province of Sabaragamuwa, and was busily employed in combating the outbreak of rinderpest which occurred in that Province. His efforts were very successful, and the outbreak ended in July. In August he exchanged stations with Mr. A. M. Fernando, and has since been stationed at Kurunegala, and the Province was free from cattle diseases during the second half of the year, except two cases of foot-and-mouth disease which occurred in Kurunegala.

In the first half of the year 144 cases of rinderpest occurred in Sabaragamuwa; 20 recoveries; inoculation was only allowed in 6 cases. The outbreak lasted from January to July.

He treated 98 cases of hoof-and-mouth disease, 97 recovered and 1 died. In June and July there was a small outbreak of a disease resembling anthrax; 16 cases, 12 deaths, and 4 recoveries. The outbreak was checked.

During the first half of the year, in Sabaragamuwa, he inspected 129 villages, and travelled 1,051 miles. The second half of the year the North-Western Province was free from cattle disease, and he was engaged in inspecting "galas," &c., in and around the town of Kurunegala.

Mr. E. W. Jayatileka, Galle.

He assumed duties as Stock Inspector, Southern Province, on 1st February. During the year rinderpest was not prevalent. Only 8 suspected cases occurred at Kotagoda in the Talpe pattu; 6 died and 2 recovered. All precautions were adopted, and no further cases occurred.

Hoof-and-mouth disease occurred during the early part of the year in the Wellaboda pattu. 174 cases were reported, 152 recovered under his treatment, 3 died; the remainder were treated by the owners.

About 20 cases of rabies came under his notice during the year. The dogs were destroyed, and any bitten were either destroyed or kept under observation for some weeks. In this connection a proper cage is recommended for the confinement and observation of suspected dogs at the Galle police station, as is adopted at the Colombo stations.

Under instructions from the Government Agent he consulted with the Mudaliyars of the Province as to the best means of improving the cattle in the Province. As an experimental effort the Mudaliyar of Weligam korale obtained from Government a tract of land near a tank at Anuregoda and a stud bull from the Government Dairy was given free of charge by Government. It was decided to start with a small stock farm, and gradually develop it into a pasture land and cattle kraal, which obviates the necessity for any large expenditure by the Village Committee, and if a failure little interests are involved.

It is intended to open and fence the land with communal labour, or by cattle owners with some help from the Village Committee funds—questions which will be decided by the Village Committee.

The question of establishing a dairy either at Hikkaduwa or Galle is also under consideration. During the year he visited 59 villages and travelled 1,085 miles.

Mr. P. C. J. Fernando, Colombo; Mr. A. M. Ahamat.

They have been in the office in Colombo during the year, doing principally office work.

Mr. Fernando has been engaged in visiting outbreaks of hoof-and-mouth disease in the Province. He treated 45 cases of hoof-and-mouth disease, visiting 10 villages, and travelled 337 miles. He also castrated 11 animals at Wadduwa during the year.

Mr. Ahamat, who was appointed in February, visited some outbreaks of foot-and-mouth disease in December.

The Province has been free from rinderpest during the year.

All the Stock Inspectors have worked well and successfully during the year, and, as is usual, difficulties are experienced in doing the work, requiring both patience and tact.

In remote villages cattle are semi-wild and often dangerous to approach. Owners are indifferent, and some almost hostile, a popular belief being that the diseases are due to the anger of the god "Gopolla," and that if efforts are made to check the disease misfortunes will fall upon themselves and their children.

At certain times of the year it is difficult to travel and get on the scene of a very remote outbreak.

To all the staff I wish to tender my hearty thanks for their work throughout the year.

III.—RETURN OF HORSES, CATTLE, AND SHEEP IMPORTED DURING 1902.

	Horses.	Cattle.	Sheep and Goats.
Colombo	469	29,232	103,806
Jaffna	19	3,202	7,306
Trincomalee	1	5	130
Galle	—	—	—

The number of cattle imported increases year by year. In 1901 24,546 cattle were imported at Colombo; in 1902 29,232 cattle, an increase of 4,686. Some of these cattle occasionally come over affected with disease, especially foot-and-mouth disease, and there is no doubt, I think, some outbreaks of rinderpest are imported in the same way. These imported cattle should be subjected to some observation, and the necessity for a quarantine station is sufficiently indicated.

IV.—IMPROVEMENT OF NATIVE CATTLE.

There is not much advance to be recorded in this direction. The two stud bulls put on the island of Delft have died from starvation, owing to drought and floods; the two on Iranativu are in good condition, and there are a number of cross-bred calves growing up, of which the owners are very proud.

The Government Agent, North-Central Province, proposed to establish regulations for the castration of cattle, and I visited Anuradhapura in November to give a demonstration of the method recommended to the owners. Thirty bulls were operated upon—the property of different owners—all successfully, and the work can be carried out by the Stock Inspector when regulations are framed and instruments provided.

The Government Agent, North-Western Province, and the Ratemahatmaya of the Wanni hatpattu, the Hon. Mr. S. N. W. Hulugalle, are also taking up the question of systematic castration.

V.—HORSE-BREEDING ESTABLISHMENT, DELFT AND IRANATIVU.

Full particulars of the establishment will doubtless appear in the Government Agent's report.

I visited the islands in January, and again in October, and carried out the necessary work with reference to branding, castration, shipping, &c. Ten colts were operated upon, all successfully.

Owing to the scanty pasture heavy loss occurred amongst the foals during the year, the mothers not having sufficient milk for them. This was due first to drought, and then to floods which covered up a great deal of the pasture and only subsided at the close of the year.

Another reason for the scanty pasture is the enormous number of cattle, goats, and sheep on the island. Several thousands died of starvation during the year. There are too many for the pasture; their extremely small size (some of them not much larger than sheep dogs) indicates the difficulty there is in getting enough to eat. Butchers taken up from Colombo to buy cattle and establish a trade laughed at the cattle and declined to buy any.

Any one who knows anything at all of stock raising must have been very amused in reading the various accounts published of the hardships encountered on Delft by the presence of the handful of ponies in comparison to the number of cattle.

The figures given speak for themselves. It was stated that there were 14,000 cattle, 8,000 sheep and goats, and 250 buffaloes on 10,000 acres of grazing land, if my memory is correct.

The grazing land is in parts coral rock, swampy areas in which the principal pasture is a kind of moss, areas of recently cultivated land, and areas of good (or what is called good) pasture. The grass is the fine grass common in Ceylon, but is very thin, and I have never seen it in sufficient abundance to cover one's boot sole.

It is said 14,000 cattle, 8,000 sheep and goats, 250 buffaloes, and 78 horses are kept on this available 10,000 acres of grazing land. The best pasture in the world would not carry them, much less a pasture subject to drought for half the year.

The horse establishment on Delft numbers in all 78, including mares, stallions, and foals; the presence of these is said to be a great hardship to the people, eating all the best pasture from their stock.

There is no restriction as to pasture or water, and horses, cattle, &c., roam over the same land. While I was at work in the horse kraal on the horse plains hundreds of cattle were grazing outside the walls and around my camp all day.

A parallel case would be for a man to have one horse grazing on Galle Face and another man a hundred cattle, the latter accusing the owner of the horse of inflicting hardship upon him by taking all the best pasture.

On Iranativu the case is different; the owners reduced their cattle and goats as advised, with the result that there is a plenty of pasture for all—ankle deep—and all the animals are in excellent condition.

Showing how much interest is taken in the cattle on Delft, it is nearly impossible to get a pair of bulls to pull a cart, and having obtained them very few can be driven, being absolutely untrained. I do not think there is a single pair of trained cart bulls on the island.

In travelling about the island a cart is pulled by coolies, and one generally walks.

Parasites.—The ponies and cattle are pestered by ticks and flies; the ticks are successfully combated on the young foals by periodical dressing with a mixture of Stockholm tar, sulphur, and oil; on the older horses it is difficult to do anything to prevent the worry of flies.

I collected specimens of the two common flies and forwarded them to Mr. Green, Government Entomologist, who reported as follows:—

> The large fly is *Hippobosca maculata* (Leach), a blood-sucker, and has strong, sharp, irritant claws, does not lay eggs, the carval stage being passed in the ovaries of the parent, and finally extruded as pupa, which hatches out as a fly.
>
> There is no external larval existence.
>
> The small fly was new, and was sent by Mr. Green to Mr. E. E. Austin of the British Museum, who reported that it is a species of *Lyperosia* (Fam. Muscidæ), and in all probability new, since, as far as he was aware, no species of *Lyperosia* has yet been described from the Oriental region. The specimen forwarded being very near to *Lyperosia minuta* (Beggi) from Somaliland, but appears to be distinct. In England *Lyperosia irritans*, with its allies *Hæmatobia stimulans* (Mg.) and *Stomoxys calycritans* (L.), is a common plague of cattle and horses in the fields in summer.

At the Horse Show held in Colombo in August the first prize for country-bred ponies was awarded to a Delft pony, "Rajah," the property of Sir F. Burdett, Bart., A.D.C.

VI.—OTHER ESTABLISHMENTS.

Attendance, &c., has been given throughout the year to the horses of His Excellency the Governor's Bodyguard and draught bulls of the Public Works Department and Convict Establishment, as well as the animals at the Government Dairy and Model Farm.

VII.—GOVERNMENT DAIRY.

Disease amongst Stock.—Beyond minor ailments, there has been no disease amongst the stock during the year. Seven old cows and seven calves died during the year from all causes, out of 219 head of cattle.

Purchase of Stock.—Two batches have been imported from India: a batch of 15 in March and 10 in October; 3 cows were purchased locally, making a total of 28 purchased.

Sales of Stock.—Two sales were held during the year. In March 21 calves and 20 cows were sold, realizing Rs. 1,381·03; in October 20 calves, 6 cows, and 2 bulls were sold, realizing Rs. 1,513·63; making a total of Rs. 2,894·66.

Working of the Dairy.—The Dairy accounts show successful working during the year. The total expenses of the year were Rs. 24,377·83, and the receipts by the sale of stock and milk Rs. 27,653·59, giving a profit of Rs. 3,275·76.

The figures will be seen in the statements annexed. The amount realized as profit by the sale of milk has exceeded any previous year.

The balance due to Government on the original votes of Rs. 31,039·12 in 1893 and 1894 was paid off last year, leaving stock and buildings valued at about Rs. 23,000 clear of debt. This year, in addition, there is a credit balance in the Treasury of Rs. 9,652·61 in addition to the amounts recoverable for November and December, amounting to Rs. 5,791·30, which must be added, giving a total credit balance of Rs. 15,443·91 to the Dairy and Model Farm at the close of the year. The total assets of the Dairy and Model Farm are estimated at Rs. 43,843·91. Liabilities nil.

The Dairy continues to be managed by Mr. J. A. G. Rodrigo, and I am pleased to be able to record that in appreciation of his services as manager the rank of Honorary Muhandiram was conferred upon him by His Excellency the Lieutenant-Governor on the occasion of His Majesty the King's Coronation.

The following statements are annexed:—

A.—Receipts and Expenditure of the Dairy for 1902.
B.—Receipts and Expenditure of the Model Farm, 1902.
C.—Financial Statement of the Government Dairy and Model Farm for the Year 1902.
D.—Capital Account of the Government Dairy for 1902.
E.—Balance Sheet showing the position of the Government Dairy and the Model Farm at the end of 1902.
F.—Live Stock Return of the Government Dairy for the Year 1902.
G.—Live Stock Return of the Model Farm for the Year 1902.

VIII.—MODEL FARM.

The farm started in January, and has been successfully worked during the year by Mr. P. Samaranayaka, the manager resident on the farm, who has worked throughout the year to make the farm a success.

Stock: Cattle.—At first some Scind cattle were sent to the farm from the Government Dairy. They suffered from the drought considerably and did not thrive, and were all returned, except six calves. It was then decided to purchase native cows and cross them with a Scind bull. Nineteen native cows were purchased and put on the farm. These so far have done well, and should come into profit in 1903.

Sheep and Goats.—Eleven native ewes and eleven lambs and three New Zealand ewes were purchased. Some were put to a half-bred Australian ram and others to a good native ram. During the year nine lambs were born, three males and six females. The former will be sold, and the latter remain in the herd for breeding purposes.

So far the sheep have been successful, and would have been more so had there not been such prolonged droughts during the year.

Five goats were purchased in Scind, but have not turned out successful, as they could not stand the climate. They became affected with a form of giddiness and rheumatism and three died. Four kids were born, of which two died.

Garden Produce.—As an adjunct to the farm a vegetable garden was started, and the following were cultivated experimentally on a small scale, with success. Lettuce, radishes, horse radish, vegetable marrow, spinnach, yams of different kinds, luffa (of two kinds), snake gourd, water gourd, beans, melon, brinjal, and pumpkins. They were sold locally; the amount realized will be seen in the statement annexed.

The following have been planted on a more extensive scale:—Chillies, pineapples (both Mauritius and Kew), plantains (of different varities), and manioca. The area planted with these is about 1½ acre. They are of a more permanent nature, and should begin to give a profitable yield in 1903.

Grass.—About 4 acres of land is under Mauritius grass for the cattle on the farm, and any in excess of requirements is sold. The grazing land of the farm is provided by the golf links.

Income and Expenditure.—The amount derived by sale of vegetable, grass, and sheep is Rs. 322·43. Revenue from lands leased to Golf Club, Messrs. W. H. Davies & Co., Colombo Commercial Company, Limited, Municipal Council, and small cultivators of grass is Rs. 4,756·50; total Rs. 5,078·93.

The expenditure, including rent paid to the Hon. the Government Agent, Manager's commission, purchase of stock, implements, and cost of a sheep shed, amounts to Rs. 3,490·08, leaving a balance of Rs. 1,588·87. Of the expenditure, Rs. 1,350 has been paid to the Hon. the Government Agent as rent, Rs. 766·02 has been spent on stock, implements, and shed. Credit may therefore be taken for Rs. 3,704·87 as profit, and actual expenses of the farm to Rs. 1,374·56. Statements of receipts and expenditure and stock on hand are annexed.

April 7, 1903.

G. W. STURGESS, M.R.C.V.S.,
Government Veterinary Surgeon.

WASTE LANDS DEPARTMENT.

REPORT OF THE SETTLEMENT OFFICER FOR 1902.

General.—The year 1902 was marked by a further expansion of the Waste Lands Department, the Galle District and the Province of Uva being added to the Settlement Officer's charge. The system adopted last year was continued of working chiefly on the block plans and of completing the settlement of claims village by village. As each village was completed a village report was drawn up and forwarded to the Revenue Officer for his guidance.

2. There was a great improvement, especially towards the end of the year, in the supply of plans, and this difficulty now appears to be in a fair way to being overcome.

3. Much more work was cast upon the Government Printer by the increase in the number of notices and final orders, but, notwithstanding this, all the printing was done expeditiously and in a most satisfactory manner.

4. The addition of a draughtsman to the staff enabled sketches to be prepared with rapidity, and greatly diminished correspondence with the Survey Department.

5. The official title of the Special Officer was altered to that of Settlement Officer on the orders of His Excellency the Governor.

6. *Notices.*—The number of notices prepared during the year and their disposal was as follows:—

District.	No. of Notices prepared.	No. of Notices published.	Balance in the hands of the Waste Lands Committee and of the Government Printer.
Galle	19	19	—
Matara	360	285	75
Hambantota... ...	34	9	25
Uva	128	74	54
Total ..	541	387	154

7. *Details of Work.*—A few particulars regarding the work done in the various districts and a return giving the result of the year's working for the four districts are subjoined.

8. *Sales.*—A sum of Rs. 2,307·50 was realized in the Matara District by the sale of lands in terms of settlements arrived at, the area thus disposed of being 196 acres 2 roods and 25 perches.

9. *Claims and Inquiries.*—The number of claims preferred during the year was 125, and the number of inquiries held was 96.

10. *Sketches.*—The number of sketches prepared by the Department was 862.

11. *Quarters.*—In April the room till then occupied as an office was handed over to the Biologist in charge of the Marine Laboratory, and the Special Officer transferred his staff to the two rooms previously utilized by the Master Attendant.

12. *Expenditure.*—The expenditure during 1902 was as follows:—

	Rs. c.
Personal Emoluments	17,853 66
Other Charges	9,365 12
Total ...	27,218 78

Statement showing the Result of the Working of the Waste Lands Ordinances in the Southern and Uva Provinces during the Year 1902.

MATARA DISTRICT.

13. *Area completed.*—Prior to 1902 the total area settled in the Matara District under the Waste Lands Ordinances was 46,131 acres 1 rood and 30 perches; during the present year a further extent of 28,453 acres 2 roods and 26 perches was completed, making 74,585 acres and 16 perches in all.

14. *Particulars of Progress.*—The most rapid progress was made in the Morawak korale. The plans of the forty-six villages surveyed up to the end of 1901 having been received, notices for all of them were completed during the year. Thirty-three villages have now been settled, and it is expected that the remaining thirteen will be finished by July, 1903. The villages of Mederipitiya, Patawala, Pallegama, Matugobe *alias* Deniyaya, and Kiriwaldola were surveyed during the year, and the settlement will be taken up as soon as the plans are received. Progress in the other divisions of the Matara District was confined to dealing with lots shown on preliminary plans or Waste Lands Ordinance surveys. The block survey plans of the villages in Gangaboda and Kandaboda pattus are now, however, being received, and the preliminary steps are being taken with regard to the waste lands situated in them.

15. *Notice Register for Matara Kachcheri.*—A complete indexed register of all the Matara notices and their results was supplied to the Assistant Government Agent with a view to its being kept up to date, thus rendering reference easy and obviating a great deal of correspondence.

16. *Litigation.*—The litigation during the year consisted of two reference cases brought forward from 1901 and ten new institutions.

17. In the two cases of 1901 judgment was entered for the Crown.

18. In two of the cases instituted in 1902 judgment was entered for the Crown by default. The remaining cases were pending at the end of the year.

19. *Increase of Work.*—The rate of progress in the Matara District as regards the area settled was well maintained, but, as the blocks dealt with were in most cases small, there was a great increase in the number of notices and final orders issued, and naturally in the clerical work connected with them. By the introduction of improved methods, however, no difficulty was felt in coping with the work.

20. *Returns.* — The annexed return shows the results attained in this district since the introduction of the Ordinance up to 1901 :—

Statement showing the Results of the Working of the Waste Lands Ordinances in the Matara District since the introduction of the Ordinances up to 31st December, 1901.

21. The balance of work brought forward on the 1st January, 1902, consisted of 108 notices relating to an area of 21,494 acres 3 roods and 4 perches; during the year 312 notices, involving an area of 27,268 acres 1 rood and 18 perches, were issued; making with the balance brought forward a total of 420 notices and an extent of 48,763 acres and 22 perches. The following return shows that of this total 28,453 acres 2 roods and 26 perches were finally settled. Notices were abandoned regarding an extent of 74 acres and 17 perches. Considerable progress has been made with the settlement of the balance 20,235 acres 1 rood and 19 perches, as will be seen from the return given on page 5 :—

Statement showing the Working of the Waste Lands Ordinances in the Matara District during the Year 1902.

HAMBANTOTA DISTRICT.

22. *General.*—During the earlier part of the year the Special Officer's work consisted in concluding the inquiries in the notices taken over from the Assistant Government Agent in 1901, and in preparing fresh notices for some preliminary plan blocks. Towards the end of the year the block plans of Saputantirikanda, Warapitiya, Handugala, and Kebellaketiya in Giruwa pattu west and of nine villages in Magam pattu were received. The two first-named villages were inspected in November, and notices drawn up for the waste lands situated in them. The preliminary steps have been taken regarding the others.

23. *Progress of Block Survey.*—The block survey party surveyed a large number of villages in Giruwa pattu west during the year, and settlement work on a larger scale will be started in 1903.

24. *Indexing Staff.*—Meanwhile a small extra staff has been engaged, under the supervision of the Special Officer, in arranging and indexing the records relating to waste lands in the Hambantota District. It is expected that this new procedure will greatly facilitate the work of settlement.

25. *Returns.*—Tables similar to those relating to the Matara District are annexed :—

Statement showing the Results of the Working of the Waste Lands Ordinances in the Hambantota District since the introduction of the Ordinances up to 31st December, 1901.

GALLE DISTRICT.

26. *General.*—The Settlement Officer's work in this district was confined to taking over from the Government Agent of the Southern Province the pending notices, to entering up the results of previous years in the new form recently adopted, and to issuing a small number of notices regarding two villages in the Hinidum pattu and a few other scattered lots. A considerable number of villages in the Hinidum pattu were surveyed during the year, and Waste Lands Ordinance operations on a larger scale will be initiated as soon as the plans are received.

27. *Returns.*—The returns annexed give the same particulars as in the case of Matara District :—

Statement showing the Result of the Working of "The Waste Lands Ordinances, 1897, 1899, and 1900," in the Galle District since the introduction of the Waste Lands Ordinances up to 31st December, 1902.

PROVINCE OF UVA.

28. *General.*—About the middle of the year the Special Officer took over all the pending notices from the Government Agent, and commenced working off the twenty-two block survey plans that had been supplied. By the end of the year the notices relating to the waste lands shown on all these plans had been prepared and a good start made with their publication. The settlement of the village of Katugaha was also completed.

29. *Supply of Plans.*—A large supply of plans was received from the Surveyor-General towards the close of the year, and rapid progress is anticipated in 1903.

30. *Extra Staff.*—The services of two extra clerks were allowed to deal with this division.

31. *Returns.*—The returns annexed show the progress so far made :—

Statement showing the Results of the Working of the Waste Land Ordinances in the Province of Uva since the introduction of the Ordinances up to 31st December, 1901.

GOVERNMENT PRINTING OFFICE.

REPORT OF THE ACTING GOVERNMENT PRINTER FOR THE YEAR 1902.

THE expenditure for which the Government Printer was responsible in 1902 was Rs. 238,158·07, an increase of Rs. 22,661·12 over that of 1901 :—

1901. Rs. c.		Heads of Service.		1902. Rs. c.
44,953 89	...	Personal Emoluments ...	...	43,184 43
684 94	...	Exchange Compensation ...	...	428 39
28,083 81	...	Other Charges ... Contingencies ...	...	30,137 23
63,006 74	...	Other Charges ... Miscellaneous Services	...	76,257 1
57,994 71	...	Advances ... Printing ...	...	69,178 44
15,613 48	...	Advances ... Binding ...	...	14,537 71
5,159 38	...	Miscellaneous Services (Commissioner of Stamps)	...	4,434 86
215,496 95				238,158 7

Increased demands were responsible for increased expenditure, to meet which the Supplementary Supply Bill of the year included votes for Rs. 27,000, of which Rs. 12,000 was for paper, Rs. 8,000 for wages, and Rs. 7,000 for plant and material.

In addition to the above, there was an expenditure by the Public Works Department of Rs. 1,791·99 on alterations and repairs to buildings.

Deducting recoveries on Revenue Account (Rs. 22,322·74) and repayments on Advance Account by independent public bodies and private parties (Rs. 17,635·44), the nett cost of the Establishment in 1902 was Rs. 198,199·89, as compared with Rs. 190,679·28 in 1901.

A Departmental classification gives the following results for the two years :—

Expenditure of 1901. Rs. c.				Expenditure of 1902. Rs. c.
181,623 6	...	I.—Book and Job Printing ...	...	198,370 98
1,083 28	...	II.—Railway Ticket Printing ...	...	1,187 24
8,675 9	...	III.—Stamp Printing ...	...	7,012 17
17,320 66	...	IV.—Binding	...	15,181 65
9,539 96	...	V.—Plant and Material ...	...	16,191 88
218,242 5				237,943 92

The difference between the total given under Heads of Service and that under this Departmental classification (which may be called the corrected expenditure) is due to the fact that the former includes what was paid for during the year, while the latter takes into account the value of paper and materials actually used.

The nett increase on all branches in 1902 was Rs. 19,701·87.

I.—BOOK AND JOB PRINTING.

Book Printing shows an increased expenditure of Rs. 27,172·58, and Job Printing a decrease of Rs. 10,424·66.

Taking the figures for both branches, there was an increase in 1902 in the cost of composition, machine and warehouse work, ruling, and foundry of Rs. 12,178·08, in proof-reading of Rs. 1,561·89, in paper of Rs. 2,141·70, and in general charges of Rs. 866·25 over 1901.

The percentage which General Charges (Rs. 27,249·57) bear to Work Charges (Rs. 111,979·09) is 24·33 (Superintendence 15·72, Clerical Staff 3·96, Casual Expenses 3·08, and Leave 1·57), as compared with 29·08, 27·76, and 27·10 in the three previous years. Superintendence exhibits a decrease on 1901 of 3·54 per cent. and Clerical Staff of 0·24 per cent., while Casual Expenses and Leave show slight increases.

The proportion of Reading to Composition is 25·86 per cent., compared with 31·78 in 1900 and 33·29 in 1901. This includes a share of the salaries of the superintending staff, by whom most of the proof-reading in its later stages is done.

Of the amount paid for Composition, Rs. 28,901·74, or 65·36 per cent. of the whole and 72·36 per cent. of the Bookwork composition (as compared with 56·07 and 65·94 per cent. respectively in 1901), represents the earnings of the piecework hands.

The percentage which Superintendence (Rs. 17,607·91) bears to the total corrected expenditure of the year (Rs. 237,943·92) is 7·40, as compared with 9·65 in 1900 and 8·59 in 1901.

In the following statement the cost of Bookwork and Jobwork, classified under Departmental sub-heads, is shown in comparison with 1901 :—

1901.					1902.		
Bookwork.	Jobwork.	Total.			Bookwork.	Jobwork.	Total.
Rs. c.	Rs. c.	Rs. c.		Work Charges.	Rs. c.	Rs. c.	Rs. c.

Bookwork.

As detailed in Appendix I., 38,626 pages of Bookwork of different sizes were printed in 1902, an increase of 13,409 pages over 1901. The cost was Rs. 108,942·61, an increase of Rs. 27,172·58, of which Rs. 20,792·01 was in work charges (Rs. 11,987·30 for composition alone) and Rs. 6,380·57 for paper.

1901. Pages printed.	Cost. Rs. c.	Size of Page.	1902. Pages printed.	Cost. Rs. c.
17,058 ...	61,855 37 ...	Foolscap folio and above...	24,407 ...	83,756 92
34 ...	118 46 ...	Demy 4to. ...	76 ...	252 99
156 ...	87 16 ...	Crown 4to. ...	— ...	—
4,496 ...	11,016 86 ...	Royal 8vo. ...	9,809 ...	14,653 66
1,759 ...	4,119 37 ...	Demy 8vo. ...	2,264 ...	4,706 47
1,714 ...	4,572 81 ...	Crown 8vo. ...	1,866 ...	5,081 28
— ...	— ...	Foolscap 8vo. ...	204 ...	491 29
25,217	81,770 3 ...	Total ...	38,626	108,942 61

Reducing the different sizes of pages to a common standard of foolscap folio, the increase over the previous year's work is 10,069, the total (30,773, or 106 foolscap pages per working day) forming a record which will be hard to beat.

To the increase of 7,349 pages in foolscap folio the *Gazette* contributed 5,250, chiefly due to announcements under the Waste Lands Ordinances ; of these, there were 486 preliminary notifications (each forming as a rule a four-page supplement and receiving six publications) and 425 final orders—together 911—illustrated by 1,244 maps engraved on metal and perforated for the insertion of type. In seven years the *Gazette* has increased in size from 4,804 to 17,290 pages, its cost in the same period having risen from Rs. 17,478 to Rs. 48,370. An issue of 100 pages was at one time considered exceptional, but during last year the ordinary weekly publications (including the connected *Hue and Cry*) averaged 332, the record number, that dated August 29th, extending to 466 pages. It will be readily understood that the work of putting into type, printing, binding, and posting such a bulky volume each week taxes the Staff and machinery to their utmost, and if the growth of this publication continues at its present rate an extension of the Office, and the erection of more machinery, will soon be necessary. During the year 27 new hands were added to the Staff, and through inability to employ more (owing to lack of room, machinery, and appliances) no fewer than 82,000 hours of overtime had to be worked to keep pace with the demands made.

Our *magnum opus* was the publication of Mr. Arunachalam's Report on the Census of 1901, issued in four volumes between July and December of 1902—without doubt the largest and most intricate typographical undertaking ever accomplished in Ceylon. The Superintendent of Census, in reviewing the work of this Department, congratulates the Office on the admirable manner in which the Report and voluminous tables which accompanied it were printed, and for the promptitude and care with which his demands for innumerable Printed Forms were met—over 6 million of the latter having been struck off, and despatched direct from this Office to all parts of the Island without one mistake being brought to notice. The following figures are of interest as showing the magnitude and cost of the work, in comparison with the similar operations for the Census of 1891 :—

For the Census of	Total Number of Printed Forms Issued.	No. of Pages in the Superintendent's Report.	Total Weight of the Superintendent's Report.	Total Outlay on Printing, Forms and Report.
1891 ...	1,049,350 ...	762 ...	16 cwt. ...	Rs. 13,500
1901 ...	6,026,260 ...	2,444 ...	4 tons 2½ cwt. ...	Rs. 27,300

The Civil List for 1902 was published on March 7, the Blue Book for 1901 on August 12, and the Administration Reports for 1901 (a volume of 1,054 pages) on October 11.

Nos. 6 to 17 of the Ceylon Customs Returns were promptly put in hand as each batch of "copy" was received, each Part being on sale at the Government Record Office well within the month following that for which the returns were prepared. The cost of printing was Rs. 2,119, an average of Rs. 176·60 per monthly Part.

Of the Law Reports edited by the Solicitor-General, 404 pages were dealt with as against 280 in the previous year, ten Parts in addition to the Digest of Volume V. having been issued, compared with seven Parts and a Digest in 1901.

The Public Instruction Department was supplied with 139,978 reading books and primers for use in schools, a considerable increase on the 115,500 of the previous year.

Examination Papers.—During 1902 226 examination papers were dealt with, the number of copies printed of each ranging from 25 to 200.

In addition to periodical publications, such as the Blue Book, Administration Reports, Sessional Papers, Ordinances, Civil List, *Gazette*, *Hue and Cry*, *Post Office Daily List*, *New Law Reports*, *Monthly Customs Returns*, &c., the following were the principal items completed during the year:—

Alphabetical Lists of Villages in the Western and Central Provinces of Ceylon.
Report on the Census of Ceylon, 1901, in 4 Vols.
A Register of the Estates in Ceylon.
Catalogue of the Library of the Royal Botanic Gardens, Peradeniya.
Annals of the Royal Botanic Gardens, Peradeniya, Parts III. and IV.
Price List, Government Stores Department.
Calendar of the Ceylon Medical College for 1902-1903.
Indexes of Registers of Deeds for the Colombo, Kandy, Jaffna, and Badulla Districts, 10 Vols.
Ceylon Post Office Guide for 1902.
Journals of the Ceylon Branch of the Royal Asiatic Society: No. 51, Vol. XVI., 1900; No. 52, Vol. XVII., 1901.
The Art of Teaching: a Handbook for Teachers in Ceylon.
A reprint of the Sinhalese Translation of Part II. of the Mahawansa.
A History of England (in Sinhalese).
A History of Ceylon (in Sinhalese).
A Sinhalese-English Grammar and Exercise Book.
Lessons on Domestic Economy (in Sinhalese).
A Sinhalese Hymnal.
A Railway Pocket Time and Fare Table.

The following works were in hand at the close of the year:—

A third edition of the Itinerary of Principal Roads in Ceylon.
Mahasadda Niti, a Pali Grammar.
Book Catalogue, and a Catalogue of Moths, for the Colombo Museum.
Journals of the Ceylon Branch of the Royal Asiatic Society: a reprint of No. 1, Vol. I., 1845; No. 53, Vol. XVII., 1902.
A reprint of Vol. V. of the Supreme Court Circular.
Addresses of the Governors of Ceylon to the Legislative Council, Vol. IV.
Ceylon Post Office Guide for 1903.
Indexes of Registers of Deeds: Colombo, Divisions C and M.
Working Book and Rules and Regulations for the Railway.
Alphabetical and Numerical Lists of Villages in the Province of Uva.
Papers for a Conference of Government Agents.
Register of Books printed and published in Ceylon.
A Manual for the use of the Irrigation Department.
A Manual for the use of the Prisons Department.
Salary Computer, for the use of Government Departments.
The Ceylon Manual for 1903.
A revised edition of the Old Testament (in Sinhalese).
Code Book for the Railway Telegraph Department.
A Glossary of Native, Foreign, and Anglicized Words in use in Ceylon.

The table given below is interesting as showing the growth of work in the Bookwork Branch during the past seven years. It will be noted that though the outturn has practically trebled during the period, yet the cost in 1902 was little more than double that of 1896:—

Year.	Pages of various Sizes.	Equivalent in Foolscap Folio.	Cost. Rs. c.
1896	13,007	10,683	49,630 2
1897	15,030	12,416	53,887 6
1898	16,508	13,018	60,167 65
1899	17,603	13,866	63,630 34
1900	22,378	18,319	76,301 62
1901	25,217	20,704	81,770 3
1902	38,626	30,773	108,942 61

JOBWORK.

The output of printed forms in 1902 amounted to 32 million in number, their cost being Rs. 89,428·37. This is nearly 4 million short of the total of the previous year; but the decrease is more than accounted for by the completion of the Census-taking, for which purpose 5 million special forms were issued in 1901. Excluding the special work for the Census, the demands made by other Departments in 1902 exhibit the usual steady rate of increase.

The issues to the various Public Offices are given in detail in Appendix II., from which it will be seen that the Post and Telegraph Department holds the leading position as a consumer, drawing close on 9¼ million forms valued at Rs. 27,705, as against 8¾ million valued at Rs. 27,250 in 1901. The Railway comes next with 8½ million valued at Rs. 26,080. Of the two others whose demands ran into millions, the Medical Department comes first, with close on 2 million costing Rs. 7,982, then the Registration Department with 1,920,000 valued at Rs. 19,936. The only other Department whose annual bill usually exceeds Rs. 5,000 is the Public Works, which last year was supplied with nearly three-quarters of a million forms costing Rs. 5,940.

The Judicial Departments (including Police, Prisons, and Fiscals) took 3⅓ million forms valued at Rs. 18,121, compared with 3¼ million costing Rs. 17,359 in 1901.

For the Coronation celebration, forms to the number of 120,000 were issued, in the shape of programmes, "Order of Service," invitation cards, time tables, &c., many of them printed in gold and colours, and some of elaborate workmanship.

In line-ruling nearly 3¾ million forms, involving 9¼ million rulings, were completed at a cost of Rs. 2,439·59, or 26·23 cents per 1,000 rulings, compared with 30·65 cents per 1,000 in 1901.

The number of forms perforated was 2,706,243, a slight increase over the outturn of the previous year.

Cards, envelopes, and sheets of notepaper to the number of 23,282 were embossed in gold or colours with the royal arms, &c.

The following is a summary of most of the preceding figures :—

1901.		1902.
35,959,384	Number of Printed Forms issued	32,047,716
Rs. c.		Rs. c.
34,019 75	Printing charges	27,833 96
65,833 28	Value of paper	61,594 41
99,853 3	Total cost of Printed Forms	89,428 37
135,351 4	Value at Office Price List rates	148,135 85
35,498 1	Nominal profit	58,707 48
	The cost of the following is included in the value of the Printed Forms :	
3,388,376	Number of forms ruled	3,691,970
7,605,224	Number of rulings involved	9,299,111
Rs. 2,330·63	Cost	Rs. 2,439·59
30·65 cents	Average cost per 1,000 rulings	26·23 cents
2,625,625	Number of forms perforated	2,706,243
10,307	Cards, envelopes, and notepaper embossed	23,282

The quantity, cost, and nominal value of the Jobwork of the last seven years are as follows:—

Year.	Printed Forms issued.	Cost of Paper alone. Rs. c.	Total Cost. Rs. c.	Value at Office Rates. Rs. c.	Nominal Profit. Rs. c.
1896	20,050,784	45,081 49	79,091 1	110,789 57	31,698 56
1897	22,154,749	56,829 94	90,059 83	105,216 67*	15,256 84
1898	22,808,117	50,927 74	84,523 20	109,273 71	24,750 51
1899	27,165,662	53,649 71	89,829 91	128,197 93	38,368 2
1900	28,857,510	58,767 77	91,212 82	133,046 93	41,834 11
1901	35,959,384	65,833 28	99,853 3	135,351 4	35,498 1
1902	32,047,716	61,594 41	89,428 37	148,135 85	58,707 48

* The rates for the most widely used forms were considerably reduced in December, 1896.

During the year 51 forms were added to the standard files and 20 were amended. The number of authorized forms in use is about 3,900, the majority being stereotyped, some electrotyped, while a few are kept "standing" in type.

In the Printing Department record given below a satisfactory improvement is noticeable in the output of work at the Presses during 1902. By a re-arrangement and closing-in of the Warehouse and Ruling Branches early in the year, space was made available on the ground floor of the Old Office for seven of the hand-printing presses, which till then had been scattered here and there, some in the Old Building, others in the New. To the saving of time and closer supervision which this concentration made possible, much of the increased output (which was 136 per cent. higher than in 1901) is due.

Year.	Number of "Formes" made ready.	Average Impressions taken of each.	Average Impressions taken Daily.			Aggregate Number of Impressions taken during the Year.		
			At Machines.	At Presses.	Total.	At Machines.	At Presses.	Total.
1896	9,045	893	26,447	649	27,096	7,881,329	193,450	8,074,788
1897	10,480	960	33,678	648	34,326	9,867,166	189,893	10,057,059
1898	11,219	883	33,393	796	34,189	9,681,903	236,283	9,918,186
1899	12,560	894	37,611	720	38,331	11,020,164	210,844	11,231,008
1900	15,359	1,120	46,421	626	47,047	13,637,660	183,988	13,821,648
1901	15,898	1,024	54,793	936	55,729	15,999,402	273,354	16,272,756
1902	18,707	925	57,451	2,226	59,677	16,660,937	645,543	17,306,480

II.—RAILWAY TICKET BRANCH.

Passenger tickets to the number of 4,362,841 were furnished to the Railway Department in 1902, while 214,638 previously-printed tickets were overprinted with fare or destination in the vernacular. The cost of a thousand impressions was 13¼ cents, equal to 26½ cents per 1,000 tickets (each being printed front and back).

With the opening of the Northern Railway and the extension to the Kelani Valley the larger demands made necessitated the laying down of a fourth ticket-printing machine, at a cost (borne by the Railway Department) of Rs. 2,215. We now possess four of Messrs. Waterlow & Sons' useful appliances, which perform the dual operation of printing and numbering the tickets simultaneously. Blank pieces of cardboard are placed in a tube on the right-hand side of the machine, and being taken automatically one by one, are printed and progressively numbered for each station as required, and collected in another tube at the left, at the rate of 6,500 per hour. Steps have been taken to procure a fifth machine, of similar construction to those now in use, but of somewhat less

complicated workmanship, for printing notices on the backs only, at a speed of 12,000 per hour. With this fast-running addition to our plant a large number of stock tickets may be partly printed during the slack period, and put away until the busy season arrives, when the time saved will be greatly appreciated. In this connection it is interesting to note that at the close of last year there were 103 stations open for passenger traffic in the Railway System of Ceylon. As each station issues first, second, and third class single, and first, second, and third class return tickets, from itself to each of the other 102 stations, it follows that no less than 63,654 different and entirely distinct forms of ordinary passenger tickets have to be dealt with, besides many thousands of special issues, such as excursion, sleeping car, workmen's, and cooly tickets.

The following figures show the output and cost of tickets during the last five years :—

Year.	Tickets supplied.	Tickets overprinted.	Impressions involved.	Cost of Printing.* Rs. c.	Cost per 1,000 Tickets.
1898	2,907,732	163,800	6,232,175	768 69	24½ cents
1899	3,175,754	450,900	6,988,056	934 79	26¾ ,,
1900	3,549,149	502,133	7,618,506	912 32	24 ,,
1901	3,607,797	872,809	8,102,703	1,083 28	26¾ ,,
1902	4,362,841	214,638	8,961,370	1,187 24	26½ ,,

* The cardboard tickets are supplied by the Railway.

III.—STAMP-PRINTING BRANCH.

Details of the 3½ million items of stamped stationery manufactured in the Office during the year are given below :—

	Number supplied in 1902.	Bearing a Face Value of Rs. c.	Produced at a Cost of Rs. c.	Rate per 1,000. Rs. c.
2-cent Post Cards	1,453,775	29,075 50	3,118 96	2 14
4-cent Reply Post Cards	14,500	580 0	74 86	5 16
6-cent Post Cards	12,500	750 0	39 58	3 16
5-cent Letter Cards	777,90	3,889 50	320 25	4 11
2½-cent District Envelopes	30,000	750 0	133 19	4 43
5-cent Envelopes	223,495	12,292 22½	1,323 25	5 92
2-cent Printed Matter Wrappers	1,725,150	34,503 0	1,847 6	1 7
5-cent Printed Matter Wrappers	47,700	2,385 0	82 50	1 72
5, 60, and 80-cent Telegraph Stamps	48,000	14,850 0	56 41	1 17
Total	3,632,910	99,075 22	6,996 6	
Add cost of overprinting Postage and Revenue stamps			16 11	
			7,012 17	

In addition to the above, 25,000 Service Post Cards, 168,000 Savings Bank Labels, and 1,600 Prisoners of War Currency Notes were manufactured during 1902, while 434,400 Postage Stamps were overprinted "On Service" and 1,200 Revenue Stamps were converted into "Warehouse Warrants."

The supplies to the Stamp Office during the last five years have been as follows :—

Year.	No. of Items.	Face Value. Rs. c.	Cost. Rs. c
1898	3,405,099	131,912 68	6,596 94
1899	3,067,463	141,842 24	6,111 18
1900	3,309,621	109,445 2	6,340 19
1901	3,954,595	142,865 42	8,580 69
1902	3,632,910	99,075 22	6,996 6

IV.—THE BINDERY.

As a result of the employment of skilled supervision in the Bindery the record for the year is most satisfactory. With the improved and labour-saving methods adopted, work was not only better done, and in a more expeditious manner, but with fewer men and at considerably lower cost. On an expenditure less by Rs. 2,139 the outturn was 37 per cent. greater, the profit rising from Rs. 3,081·50 in 1901 to Rs. 7,868·98 in the year under review. In 1886 thirteen men and boys were employed—there are now between 40 and 50. In the same year (when a Foreman was first appointed) the number of books bound was 25,000—last year the total had risen to 284,284, though the expenditure had increased but five-fold (from Rs. 3,000 to Rs. 15,181).

The following table gives in detail the cost and output of work for the last two years :—

1901. Rs. c.	*Expended.*	1902. Rs. c.
10,592 86*	In labour	9,557 46*
6,727 80	In materials	5,624 19
17,320 66		15,181 65
16,772 47	Recoveries	20,646 16
3,629 69	Work executed free of charge	2,404 47
20,402 16		23,050 63
3,081 50	Profit	7,868 98

* Includes salaries paid under Personal Emoluments and Permanent Staff for 1901, Rs. 1,374; under Permanent Staff for 1902, Rs. 487·50.

1901.	*Outturn of Work.*	1902.
3,216	Full Bound — Leather	5,423
67	Full Bound — Cloth	37
498	Half Bound — Cloth	508
6,827	Half Bound — Paper	7,153
7,932	Stiff Covers — Paper on boards	11,046
2,383	Limp — Cloth	3,408
8,193	Limp — Paper(cloth-lined)	8,771
146,834	Wire-stitched in Paper Wrappers	178,941
31,025	*Gazettes* wire-stitched	68,997
206,975		284,284
	Miscellaneous.	
9,958	Blocks of forms mounted	15,345
59,750	Envelopes made	27,750
9,568	Printed forms cloth-lined	7,438
221,154	Other miscellaneous work	119,231
1,296,721	Impressions at hand paging and numbering machines	1,466,805

There is a steadily-growing demand for a superior class of work, though we are still chiefly employed in binding printed forms, school books, &c., in an inexpensive manner. The number of books bound (full, half, stiff covers, and limp) was 36,346, against 29,116 in the preceding year, the wire-stitched items showing an increase of 70,079. Envelopes are made by hand, obsolete printed forms being utilized where possible.

Full details for Departments are given in Appendix III., the following statement showing the progressive increase of work during the last seven years :—

Year.	No. of Books Bound.	Books Thread- or Wire-stitched.	Miscellaneous Work.	Expenditure. Rs. c.	Profit. Rs. c.
1896	18,274	100,758	43,956	7,837 2	2,152 82
1897	19,195	140,888	21,322	9,828 37	2,338 1
1898	22,863	144,510	118,508	11,887 92	2,514 79
1899	31,898	138,555	111,369	13,165 44	4,714 95
1900	28,348	158,237	197,449	12,589 70	3,464 33
1901	29,116	177,859	300,430	17,320 66	3,081 50
1902	36,346	247,938	169,764	15,181 65	7,868 98

V.—THE FOUNDRY.

The Foundry expenditure was Rs. 3,204·01, an increase of Rs. 200·04 over 1901 :—

1901.		1902.	1901.		1902
Rs. 1,073·96	Stereotyping	Rs. 1,168·16	Rs. 1,862·40	Labour	Rs. 1,859·63
Rs. 1,041·40	Type-casting, &c.	Rs. 792·04			
Rs. 461·03	Leads and Furniture	Rs. 652·16	Rs. 1,141·57	Materials	Rs. 1,344·38
Rs. 427·58	Engraving	Rs. 591·65			
Rs. 3,003·97		Rs. 3,204·01	Rs. 3,003·97		Rs. 3,204·01

Stereotyping.—The stereotype plates cast show an increase in number of 893 and in weight of 456 lb., the cost working out at 28·87 cents as compared with 29·92 cents per pound in 1901.

1901. No. of Plates cast.	1901. Weight. lb.	1901. Cost. Rs. c.		1902. No. of Plates cast.	1902. Weight. lb.	1902. Cost. Rs. c.
1,015	799	241 20	Bookwork	781	1,046	301 98
1,624	2,791	832 76	Jobwork	2,751	3,000	866 18
2,639	3,590	1,073 96		3,532	4,046	1,168 16

Type-casting.—Work in the Type Foundry was practically at a standstill for six months of the year, nearly the whole of our moulds and matrices having to be returned to the makers for alteration. The 1,714 lb. of work done was in supplying figures, &c., to founts of bookwork type obtained from England, in which these characters had been purposely omitted, it being possible to manufacture them locally at a much cheaper rate than they can be bought in the home market. The price in England is equivalent to Re. 1 per lb.—we produce each pound in our Foundry for about 50 cents.

Year.	Type cast. lb.	Cost. Rs. c. Cents.	Value, allowing for old Metal utilized. Rs. c. Cents.
1898	671	416 69 = 62·11 per lb.	431 24 = 64·27 per lb.
1900 *a*	1,256	593 55 = 47·25 per lb.	703 72 = 56·02 per lb.
1901	3,297	1,041 40 = 31·59 per lb.	1,651 4 = 50·08 per lb.
1902	1,714	792 4 = 46·21 per lb.	880 78 = 51·39 per lb.

Leads and Metal Furniture.—The outturn in 1902 shows an increase over that of 1901 : 4,800 lb., costing 13·59 cents per pound, against 3,407 lb., costing 13·53 cents per pound :—

1901.	Cost.*	lb.		lb.	1902.	Cost.*
Labour	Rs. 327·64	24	Thin (8 to pica) leads	303	Labour	Rs. 330·11
Materials	Rs. 133·39	1,799	Thick (4 to pica) leads	2,670	Materials	Rs. 322·05
		718	Long primer clumps	816		
	Rs. 461·03	866	2, 3, and 4-m metal furniture	1,011		Rs. 652·16
= 13·53 cents per pound.		3,407		4,800		= 13·59 cents per pound.

* Value of old metal not included.

Engraving.—Of the Rs. 591·65 expended, Rs. 467·56 (equal to 60 cents each) was for engraving on metal 774 maps attached to the notifications published in the *Gazette* under the Waste Lands Ordinances.

The following table shows the work of the Foundry for the past seven years :—

Year.	Total Foundry Expenditure.	Stereotyping.		Type-casting.		Leads and Metal Furniture.		Cost of Engraving.
		Weight of Plates cast.	Cost per lb.	Quantity cast.	Cost per lb.	Weight cast.	Cost per lb.	
	Rs. c.	lb.	Cents.	lb.	Cents.	lb.	Cents.	Rs. c.
1896	2,572 1	3,244	21·20	1,702	47·40	2,696	12·22	55 20
1897	2,813 25	2,897	25·77	1,850	47·47	4,396	11·53	102 84
1898	2,434 41	2,486	33·53	671	64·27	2,768	16·53	75 66
1899	2,039 54	2,759	32·36	— *a*	— *a*	2,701	16·47	246 20
1900	2,562 44	3,401	31·09	1,256	56·02	2,807	15 67	356 42
1901	3,003 97	3,590	29·92	3,297	50·08	3,407	13·53	427 58
1902	3,204 1	4,046	28·87	1,714	51·38	4,800	13·58	591 65

a In 1899 the Type-casting Plant was sent to England to be over-hauled.

VI.—PLANT AND MATERIAL.

The outlay on Plant and Material (including the cost of repairs to machinery, which under the head of Casual Expenses has in Section I. been treated as a working expense) and the expenditure in the Foundry was Rs. 17,006·90, or Rs. 7,183·75 more than that of 1901.

1901. Rs.	c.			1902. Rs.	c.
2,707	30	...	Standing Plant and Machinery	9,070	21
5,231	77	...	Type	5,166	93
1,600	89	...	Brass Rule, Leads, and Furniture	1,954	74
9,539	96			16,191	88
283	19	...	*Add*—Repairs to Machinery under "Casual Expenses"	815	2
9,823	15			17,006	90

Standing Plant and Machinery.—In March a much-needed addition was made to the Printing Department by the receipt from Messrs. Harrild & Sons, of London, of one of their latest-model double-royal "Bremner" letterpress printing machines, costing Rs. 3,360. Our printing plant was further increased by the erection of a double-crown "Albion" press from the same firm, at a cost of Rs. 792, a galley proof-press Rs. 148, and moulds for casting printers' rollers Rs. 170, while Rs. 300 was expended in glass tiles and floor slabs for letting in more light to the printing room.

In the Composing Department, Rs. 240 was spent in providing stands for additional men, Rs. 270 on type-cases for them to work at, Rs. 323 for zinc galleys, and Rs. 1,103 for wrought-iron frames (or "chases") in which to secure the set-up type for printing.

A welcome addition (at a cost of Rs. 662) was made to the Bindery in the shape of an up-to-date automatic wire-stitching machine, capable of sewing together anything in the form of paper or cardboard, from a pamphlet of 8 pages to a book 1¼ inch thick. The old system of stabbing books by hand and securing them with thread is slow and unsatisfactory: with a wire stitcher making its own brass staples, books up to an inch in thickness can be sewn at the rate of 20 per minute, and small work at double this speed. A six-wheel treadle numbering machine was also added, which will page or number books and loose forms, consecutively or alternately, in duplicate or quadruplicate, as required: it cost Rs. 542.

Mention may here be made of the "Addressograph" machine, procured at a cost of Rs. 465 in October last, by which time and labour are saved in connection with the posting of the *Gazette*, *Hue and Cry*, *New Law Reports*, &c. Previous to the receipt of this compact and ingenious labour-saving appliance the addressing and checking of a large number of postal wrappers two or three times a week was a tedious and costly operation, much liable to error. What formerly occupied a whole day is now done in less than an hour, in a neater and more readable style, and with fewer opportunities of mistakes or omissions occurring.

Other items worthy of notice are: matrices, &c., for type-casting, Rs. 330; copper stencil-plates for addressing cases and parcels in the Warehouse, Rs. 52; cabinets for locking up type, Rs. 118; a drying rack for the Stamp Printing Department, Rs. 65; and router cutters for the Foundry, Rs. 73.

Type.—Additions to the English bookwork founts are responsible for Rs. 3,406, jobbing type for Rs. 95, Sinhalese type for Rs. 849, and English type cast in our Foundry for Rs. 792.

Brass Rule, Leads, and Furniture.—Ordinary brass rule (imported) cost Rs. 404, head rules for the *Gazette* Rs. 23, leads and furniture cast in the Foundry Rs. 652·16, Hempel's patent steel quoins for securing type Rs. 735, and wooden reglet, &c. (imported) Rs. 143.

The expenditure on *Repairs to Machinery* (Rs. 815·02) was higher than usual. The loss to which we are periodically put when repairs to the steam engine are being carried out, or when the boiler is undergoing its half-yearly cleaning and over-hauling,—at which times nearly the whole of the machinery lies idle,—points to the necessity for having duplicate motive power to fall back upon, and the question of how this is to be provided, and whether by gas or electricity, should be settled at an early date.

In Appendix IV. will be found a schedule of the principal plant and material in the Office on 31st December, 1902.

VII.—CASH RECOVERIES.

The contributions to Revenue in 1902, including the sales at the Government Record Office of publications supplied by this Office, were as follows:—

1901. Rs.	c.			1902. Rs.	c.
1,779	50	...	Subscriptions to and sales of *Gazette* ...	1,612	25
4,081	59	...	Unofficial advertisements in *Gazette* ...	5,929	49
2,405	50	...	Advertisements of Fiscals' sales	3,264	50

* For the actual profit of each year see Section IV.

The *Government Gazette* (of which 72 numbers were issued during the year) had on December 31 a circulation of 590 copies, 154 going to subscribers, the balance to Government officials, reading rooms, &c. The recoveries on account of subscriptions, sales, and advertisements amounted to Rs. 10,806·24, which being deducted from the expenditure (shown as Rs. 48,370·50 in Appendix I.) reduces the nett cost to Rs. 37,564·26, as compared with Rs. 29,036·74 in 1901. Copies of the *Gazette* are sold to the public at the rate of 25 cents each, the yearly subscription, including postage, being Rs. 12; from the above figures the cost of production in 1902 works out to Re. 1·13 per copy, and the annual subscription to Rs. 82; if postage be added (Rs. 12 for the year) the rate is increased to Rs. 94.

The circulation of the New Law Reports at the close of the year stood at 192, the subscribers numbering 71.

Recoveries on account of printing and binding supplied to paying Departments, and for work executed for Road Committees, Local Boards, private individuals, &c., the cost of which is charged to "Advance" instead of to "Vote," amounted to Rs. 90,624·05, against Rs. 68,402·77 in 1901, the Railway and Registration Departments, the Imperial Government (on account of the Prisoners of War), and the Ceylon Branch of the Royal Asiatic Society, being mainly responsible for the increase :—

In Appendix V. will be found a statement of the expenditure, cash transactions, &c., and the outturn of work in each Branch of the Office, during the years 1869 to 1902.

VIII.—MISCELLANEOUS.

Establishment.

The number of names on the roll on December 31 last was 302, an increase in the Staff of the Office of 61 when compared with 1900, and 27 more than were employed on the last day of 1901. They were classified as follows :—

1902.		1901.	1902.		1901.
4	Government Printer and Assistants ...	4	12	Line-rulers	12
8	Readers and revisers	7	43	Binders and binding boys ...	48
3	Foremen	3	5	Stereotypers, typecasters, &c. ...	5
9	Clerks	9	2	Engravers	2
1	Storekeeper	1	2	Rollermakers and liftmen ...	2
1	Machine-room clerk	1	3	Engine attendant and firemen ...	3
102	Compositors	79	2	Peons	1
23	Do. apprentices ...	22	1	Cooly	1
23	Machine-minders and pressmen ...	18	7	Office boys	6
34	Machine and press apprentices and boys...	35	302		275
4	Ticket printers and counters ...	4			
13	Warehouse men and boys ...	12			

The Government Printer proceeded to England on privilege leave in July, 1901, and was absent during the whole of 1902.*

It is pleasing to acknowledge my indebtedness to Mr. H. M. Richards, Assistant Government Printer, not only for unfailing loyal co-operation, but for the able manner in which the Composing Department was worked during the year, more especially in connection with the printing of the Census Report, the supervision of which was in his hands.

Mudaliyar James Fonseka, Third Assistant, is also to be congratulated on the excellent working of the Printing and Warehouse Departments, as evidenced by the state of the "Arrears Lists." These monthly records of work not completed by the dates due afford satisfactory evidence of the quality of the supervision exercised. During 1901 the number of items on the lists was 3,697—last year, with an increase of work and fewer hours of overtime in the Machine Room, the total was but 473.

During the first ten months of the year the Bindery was in charge of Mr. F. E. O. Mörs, whose permanent appointment as its Foreman from January 1, 1903 (or as soon as he returns from short leave), on a salary of Rs. 2,000 rising to Rs. 3,000, was sanctioned in July last.† Mr. Mörs, a

* Mr. Skeen resumed duties on February 6, 1903.

† Intimation was received on March 14 that, owing to ill-health, Mr. Mörs is not able to return to Ceylon to take up the appointment.

German by birth, held a responsible post in the Imperial Printing Office at Berlin, and more recently was Instructor in the State Bindery of Pretoria. Our Binding Branch has so increased in size and importance of recent years that the selection of a Foreman with higher qualifications than those previously available was most desirable. As last year's working of the Department proves, the higher salary to be paid will be more than saved by the technical knowledge and expert methods brought to bear in management; and while efficient training will be secured for the men, work of the highest class can be undertaken.

To the chief subordinate officers, Mr. G. F. Lockhart in the Reading Room, Messrs. M. T. Soertsz and C. Fernando in the Composing Branch, and Mr. D. W. Pulle, the head of the Clerical Department, acknowledgments are due for the zeal and ability with which their duties were performed, and for the success which attended their efforts to prevent arrears of work during a year of extreme pressure.

Two retirements on pension have to be recorded for 1902: Mr. Simon Silva, Compositor, after 24 years' service, and Mr. David Perera, Machine-minder, after 27 years' service. Mr. Simon S. Perera, Electrotyper and Typecaster, retired on a gratuity after 6 years' service.

Three additions were made to the Permanent Staff, Compositors Don Pedro and Don Michael being appointed to Division A and Machine-minder Charles Dias to Division B.

Excluding 2,600 extra hours worked by the Assistants, who receive commuted allowances, there were 79,589 hours of overtime (as compared with 57,715 in 1901) registered during the year, viz., 49,630 in the Composing Department, 18,409 in the Printing Department, 4,675 in the Warehouse, 5,377 in the Bindery, 455 among the Line-rulers, 492 in the Foundry, and 551 in the Counting House. Each hour's overtime is paid for at the rate of one-seventh of a day's pay.

The fines levied in 1902 amounted to Rs. 322·58, against Rs. 244·40 in 1901; of this amount Rs. 259·91, inflicted on account of absence without leave, was credited to revenue, while Rs. 62·67 imposed for various other offences was handed over to the Colombo Friend-in-Need Society.

The cash transactions of 1902 amounted to Rs. 400,255·88, against Rs. 341,955·34 in 1901. The number of queries raised by the Auditor-General on the accounts of the Office was thirty-nine, of which four only involved actual errors, and those of a clerical nature.

The letters and memoranda addressed direct to the Government Printer in the course of the year numbered 8,198, while 3,735 were despatched by him, in addition to 8,033 advice notes. As the latter are returned receipted, the total number of documents dealt with outwards and inwards, exclusive of receipts for payments (2,629) and papers constantly passing to and from the Secretariat, amounted to 27,999.

The weight of printing paper, cardboard, &c., used during the twelve months was 194½ tons, against 181½ tons in 1901. Of this, 1,241 packages, weighing 2¼ tons, were sent to their destination through the agency of the Government Stores, and 4,241 parcels, weighing 9½ tons, were distributed by the Post Office, the balance 160¼ tons having been delivered by carts and coolies to Departments in Colombo.

Of the paper used in all branches of work in 1902, costing Rs. 88,549, local contractors supplied to the extent of Rs. 56,224·86, the value of Indian makes of this being Rs. 24,764·82.

966 orders for advertisements (against 886 in 1901) were transmitted to the local newspapers through the medium of the Government Printer; of these, 580 (against 394 in 1901) were for notices under the Waste Lands Ordinances.

"Service" postage stamps to the value of Rs. 9,431·52 were used during the year, against Rs. 7,851·41 in 1901.

Provident Fund.

Membership of the Provident Fund (managed by a committee elected by the subscribers) is compulsory on all daily paid and piecework employés. It provides for loans, with and without interest, in cases of sickness and distress, and for gratuities (1) to men retiring on account of ill-health or old age, and (2) to widows and families on the death of members, such gratuities being met by special calls. The contributions recovered from the 289 members on the roll during the Fund's financial year 1901–1902, which closed on June 30, amounted to Rs. 2,626·50. Loans to the extent of Rs. 7,677 were granted during the year, and subscriptions amounting to Rs. 811·04 were refunded to those who left the Office, while two death gratuities (Rs. 100 and Rs. 50) and two retiring allowances (Rs. 100 each) were paid. The working expenses absorbed Rs. 192·50 only. A dividend of 7½ per cent. was declared, disposing of Rs. 1,109·82 out of a profit of Rs. 1,135·31. The amount standing to the credit of members on June 30, 1902, was Rs. 15,907·47; on 31st December last it had risen to Rs. 17,386·22.

The following statement shows the growth of the Office during the past decade :—

	Employés.	Expenditure.	Pages Printed.	Size of *Gazette*.	Forms Printed.	Books Bound.
1892	192	Rs. 131,255	13,645	3,977 pages	16,084,355	84,023
1902	302	Rs. 238,158	38,626	17,290 pages	32,047,716	284,284

	Railway Tickets Printed.	Value of Stampwork Printed.	Type, Stereotypes, &c., cast.	Cash Recoveries.	Cash Transactions.	Letters dealt with.
1892	2,350,320	Rs. 57,679	5,741 lb.	Rs. 42,235	Rs. 171,162	17,656
1902	4,577,479	Rs. 99,075	10,560 lb.	Rs. 112,946	Rs. 400,255	27,999

Government Printing Office,
Colombo, February 5, 1903.

H. C. COTTLE,
Acting Government Printer.

APPENDIX IV.

Schedule of the Principal Plant and Material in the Office on 31st December, 1902.

For Ordinary Letterpress Printing.

61,000 lb. English Bookwork type (long primer, bourgeois, and brevier chiefly).
13,000 lb. Sinhalese and Tamil type.
5,000 lb. titling and jobbing type (180 founts).
34 founts of wooden type for posters.
30,000 lb. metal furniture.
2 founts steel furniture.
64 compositors' frames.
1,100 compositors' cases.
626 galleys.
9 skeleton galley racks.
3 steel-run cabinets with 40 cases (1899 and 1901).
2 letter board cabinets (1899).
15 imposing surfaces.
40 forme racks.
1 surplus type rack (1,746 compartments).
5 rule and lead cutters.
1,500 chases.
13,840 inches of Lavater's locking-up apparatus.
2,880 Hempel's steel quoins.

1 "Bremner" quad-crown (1896)
1 "Conisbee" double royal (1870)
} two-feeder printing machines.

2 "Bremner" dbl.-royal (1888, 1902)
2 "Bremner" double-crown (1885)
2 "Conisbee" double-crown (1876)
2 royal "Fleet" (1897 and 1899)
1 demy "Fleet" (1892)
2 foolscap "Fleet" (1897 and 1899)
1 half-medium Colt's platten (1893)
1 "Gordon" platten (1899)
} single-feeder printing machines.

9 "Albion" hand printing presses.
2 cylinder galley proof-presses.
2 "Wetter" automatic numbering machines (1891).
24 "Schreier" do. (1898 to 1901).
1 power line-ruling machine (1898).
5 hand line-ruling machines.
1 "Eclipse" power rotary perforator (1894).
1 treadle perforator (1874).
1 42-in. "Diamond" guillotine (1896).
1 26-in. Gill's roller (1896).
1 roller-making apparatus.
15 roller moulds.

Railway Ticket Branch.

4 Waterlow's ticket printing machines (1865, 1879, 1892, and 1902).
1 automatic counting machine (1897).
About 1,500 electro logotypes.

Copperplate printing press (1897).

Embossing and relief-stamping press (1897).

Stamp Branch.

1 half-medium Colt's Armoury platten machine (1895).
1 half-royal ditto (1898).
1 23-in. hand guillotine (1899).
1 power rotary card cutter (1896).
1 power letter card, &c., perforator (1896).
1 drying rack.

Bindery.

1 gilding and arming press (1890).
1 32-in. "Diamond" guillotine (1885).
1 backing machine (1898).
1 finishing press (1889).
1 book-stabbing machine.
1 bevelling machine (1899).
1 cornering machine (1899).
3 nipping presses.
1 "Atlas" press (1899).
2 cardboard cutters.
2 power wire-stitching machines (1895 and 1902).
3 treadle numbering or paging machines.
1 eyeletting machine (1891).
1 drying rack.
2 finishing and heating stoves (gas).
Graining plates and boards.
Brass type, borders, ornaments, rolls, fillets, &c., about 100 varieties.
1 newspaper wrapper addressing machine.

Foundry: for Electrotyping (1895).

1 electro-depositing dynamo.
1 hydraulic moulding press, moulding pans, &c.
1 blackleading trough.
1 syringe bath.
1 solution trough.
1 furnace with backing frames.
1 face lathe.
1 wax melting pot.

——*for Stereotyping.*

1 combined melting furnace, hot air chamber, and press (1882).
1 casting box with type-high cores, &c. (1876).
1 mangle for "Greyhound" flong.
1 combined beating surface and saw bench (1876).
1 Royle's router (1895).
1 bevelling plane.
1 steam saw.
2 imposing surfaces.

——*for Type, Lead, and Furniture-casting.*

1 Titchener's small work type-caster (1890).
Long primer, bourgeois, and brevier matrices, moulds, gauges, &c.
Furniture and lead moulds.

A portable forge with a supply of fitter's implements for small repairs.

A steam saw for cutting firewood, &c.

Motive Power supplied by

12 H.P. Tangyes' horizontal steam engine (1892).
16 H.P. Cornish boiler working at 60 lb. pressure (1892).
3½ H.P. Crossley's "Otto" gas engine (1896).

A Lift communicates between the Composing and Machine Departments.
